## **Author's Introduction**

This book will give you and your computer power—the power to replicate reality in a quite uncanny way. I've included a wide range of programs that allow you to experience this power in action—from a program that simulates microbes fighting for the right to survive in a closed environment, to one that puts you in the cockpit of a particularly temperamental plane.

There is also more to this book than the ready-to-run programs. You'll discover how easy it is to analyze real-life situations so that you can create your own computer simulations, for both entertainment and instruction.

**You now have the power. Use it.**

**Tim Hartnell  
London, 1986**

## **Getting the Programs Running on Your System**

I wrote the programs in this book on an IBM PC. Since you may own or use different microcomputers, I've included the full BASIC program listings for the three most popular microcomputers: the Apple IIe, Commodore 64, and the IBM PC. BASIC listings that will run on IBM PCs, XTs, and compatibles without modification are presented throughout the chapters. Program listings specifically for the Apple IIe series and the Commodore 64\* are included in the appendix at the end of the book.

I've written the programs in a subset of BASIC that will run on most microcomputers with only minimal changes. However, if you don't own an Apple IIc or IIe, Commodore 64, or IBM PC, some of the BASIC statements used in the programs may have to be changed slightly to run on your system. I've included the following notes so that if you do have to adapt the programs you'll be able to get them running as quickly as possible.

### **Screen Width**

I've assumed that you have access to the READ and DATA commands, and that your screen is about 40 characters wide. If your computer's screen is not quite that wide, you may have to adapt the program output by adjusting the PRINT statements.

### **Random Numbers**

Some of the programs need random numbers to operate. When I want a random number between one and zero, I use the command A = RND(1). If I need random integers in the range between 1 and 10, I use A = INT(RND(1) \* 10) + 1. If your system can't use this statement, you'll have to substitute the form of the RND command that will run on your computer. Look up RND or "random numbers" in your system's BASIC manual.

\*C64 users see note on p. 171.

My computer's BASIC generates the same sequence of random numbers each time a program is run. In order to get a genuinely random set of numbers, I have to seed the random number generator. I've used the rather terrifying-looking statement RANDOMIZE VAL (RIGHT\$(TIME\$,2)) to do this. If your random number generator requires a seed (again, this will be explained in your BASIC manual), replace this statement with your system's equivalent (or leave it out altogether, if you don't have an alternative).

If your computer doesn't use the BASIC statement DEFINT (often used in the line after RANDOMIZE as DEFINT A-Z) leave that line out completely as well. (See line 490 in the LIFE listing.)

## **Capital Letters**

Note that the programs expect input in upper-case letters. If your computer can use lower-case letters, and if while running the program nothing happens when you type in letter commands, check to make sure that you're typing in capital letters.

## **Input Statements**

You may also have to change my use of INKEY\$ for single character input. If your computer can't use INKEY\$, change these statements (throughout) to the input statement that works on your system. Change A\$ = INKEY\$ to either INPUT A\$ or GET A\$ (again, see your BASIC manual). The program should run without further changes. Use CALL KEY when working in TI Extended BASIC.

Note that some BASICs (such as Atari BASIC) do not let you include a string within an INPUT statement (as in INPUT "string"; A\$). Replace this with PRINT "string" followed by a separate INPUT statement.

## **READING Arrays**

Some BASICs cannot READ array values directly, as in READ A(7) or READ A\$(7). You'll have to replace these statements with lines that put data in the array indirectly. First read the data into a variable. The appropriate array element can then be set equal to the variable, as in READ X:A(7) = X or READ XS:A\$(7) = XS.

## **Printing the Results**

Many of the programs "reprint" the screen after each turn. I've used the CLS command to CLEar the Screen. If your system doesn't

use CLS, you'll have to replace it with the appropriate command. Use PRINT "CLR" on Commodore and Atari computers, HOME on Apples, and CALL CLEAR when working with TI Extended BASIC.

## **String-Handling**

String-handling can cause a few problems, so I've kept it to a minimum. If your computer does not support the standard LEFT\$, MID\$, and RIGHT\$ string-handling commands, consult your BASIC manual for the correct replacements. For example, the standard MID\$(A\$(2,3)) can be replaced with SEG\$(A\$,2,3) in TI Extended BASIC, with A\$(2 TO 5) on Timex/Sinclair computers, and with A\$(2,5) in Atari BASIC.

## **Delay Loops**

Many of the programs include a delay loop (usually in the form FOR I = 1 TO 500:NEXT I). You should adjust these dummy loops (which are usually held in subroutines at the end of programs) so that the program's displays of instructions and the progress of the simulation are clear and easy to follow. See line 550 in the SIMULTANEOUS EQUATIONS listing for an example of how this works.

## **Variables**

If your system won't accept variable names longer than two letters, enter just the first two letters (such as SC for SCORE). If it will accept a full variable name, but only recognize the first two letters, you will find that using the full variable name makes the program much easier to understand.

## **Functions**

A number of the programs in this book use the BASIC statement DEF FN to define specific functions which are then "called" from different parts of the program. Most BASICS include some form of DEF FN, the most notable exception being Atari BASIC. Functions can usually be replaced with subroutines, or, if the expression or calculation is short enough, you can simply replace each use with the whole expression.

## **High-Resolution Graphics**

The only program you may find difficult to adapt is POINT-DUTY

**ROBOT**, which requires high-resolution graphics (using a command like PSET or POINT). If your computer is capable of high-resolution graphics, you should consult your system's manual to find out the equivalent commands for your machine. If not, you'll find that the regular ROBOT LOGO listing is almost as much fun!

## **Memory**

It is impossible to predict exactly how much memory the programs will take up on your system, but the majority of the programs in this book will fit well within 16K machines. In fact, the longest program, FLIGHT SIMULATOR, is less than 8K long.

If you have trouble getting a program into your system because of a shortage of memory, cut out as many REM statements as possible (check to make sure that no GOSUB or GOTO calls refer to the lines you want to delete) and try to shorten the PRINT statements.

## **General Instructions**

These changes should cover the adaptations you'll have to make to get the programs running on your computer.

Please be sure to type programs in carefully. Remember that the instructions you give to a computer must be exactly correct—or the machine won't be able to run your program. If you have trouble getting a program to run, first proofread your typed-in version against the listing given in this book.

The manual for the BASIC that came with your computer is an indispensable tool. Check the manual to see what's wrong with any program lines that won't work—or that result in error messages. Make sure to use the exact forms of the commands as given in the manual.

Talking to someone who has a lot of programming experience—especially if it's with the computer you're using—can also be a tremendous help.

## The Power of Simulations

Computer simulations give you the power to try your hand vicariously at almost any activity you can imagine. Running a multi-million-dollar manufacturing concern, flying to the moon, driving a racing car, or running the country as President—all these experiences can be yours through simulation programs.

In this book you'll find programs that allow you to take part in all these scenarios and more. You'll also be gently introduced to the art of creating computer simulations. After you've enjoyed the programs in the book, you'll have made a good start on being able to write your own. Studying the program listings, observing what the different variables represent and the way they interact and how mathematical formulas are used to replicate "real life" situations, will show you a number of easy-to-apply techniques that you can use in your own simulations.

Despite their obvious entertainment value, computer simulations are not just elaborate games. More sophisticated simulations are being used for training in many situations where reality is too expensive, too dangerous, or too complex to allow human beings to learn by direct experience. During airplane pilot training many, many hours of airtime are clocked in elaborate flight simulators—controlled, of course, by computers—rather than up in the air.

One of the real advantages of simulations is that they can be manipulated more easily than the real situation. For example, a pilot training on a flight simulator could attempt to land during a hurri-

cane with very little fuel, or an operator at a nuclear power station could be faced with the possibility of a meltdown. Operators in conventional and nuclear power plants around the world are now training on simulators, where they can hone their skills without facing real catastrophes. One example of the use of computer-controlled simulations in this area comes from Australia, where an electricity generating board has spent half a million dollars to buy a simulator to train its operators. This simulator, developed and marketed by an Australian company called Control Simulation Technology, allows a controller to simulate a number of emergency situations, so that staff can learn to cope with them. This "emergency" training would be impossible without the use of a simulator.

Another computer simulator, which might be seen as a little bit sinister, uses the reactions of a few test subjects to television and print advertising to simulate the reaction of a significant portion of the population. The simulator, developed by psychologist Marcus Tomlian, is claimed to be "the most sophisticated precision system for measuring consumer reactions to advertisements." The device, called *Mind Monitor*, is made up of a series of sensors that measure the brain and heart activity of a sample group of people. The simulator runs while an advertisement is shown to the test group, and gives a second-by-second readout from the sensors. The readings are then fed into the simulator, which analyzes the brain waves and cardiovascular readings and uses them to extrapolate the probable reaction of the general population. Mr. Tomlian claims that *Mind Monitor* can be used to find weak points in an advertising campaign so that the advertiser can "fine-tune" particular campaign elements. General Electric is believed to be at the forefront of developing computer simulations which help gauge viewers' reaction to advertising, while one of the world's biggest ad agencies, Young and Rubicam, is also investigating the field.

## Simulation Limitations

A computer simulation, of course, must never be confused with the system it is simulating. All simulations are, to greater or lesser extents, *simplifications* of the system they represent. Low-level simulations, like the programs in this book, and the simulations you are likely to create in the next few months, are often drastic simplifications. Despite this, they can be surprisingly effective—trying to land a plane using our **FLIGHT SIMULATION** program can be almost as nerve-racking as the real thing.

You'll find that there is as much art as science involved in creating effective simulations. The science is in working out the for-

mulas that represent the interacting elements of the system you are trying to simulate. The art is in programming those formulas so that your interaction with the simulation is as "life like" and rewarding as possible. This means that the output must be realistic, and must be presented in a form that is readily understood.

For most simulations, the speed with which the program responds to user input is very important. If the simulation is occurring in "real time" (that is, a second of time elapsed within the simulation is supposed to equal a second of time in real life), it is important that the simulation is written so that this one-to-one correspondence between the times is as close as possible.

Simulations can be divided into two groups: those where the data is acted on in distinct groups or packages, and those where the data values flow into each other repeatedly and continuously. Queuing systems, where a set of elements to be processed (like a group of customers waiting in line at a bank counter) wait in a queue until the system is ready for them, are the main kind of discontinuous situations that are turned into simulations. In the second type of simulation, where data values flow into each other, values (such as the internal temperature of a nuclear reactor) change constantly over time.

It is important to try and determine, before you start programming your own simulation, which type of data or process predominates within the system you are going to program.

Any situation where elements are added to a queue at rate A and removed at rate B is a candidate for a discrete simulation. There are many, many situations like this in real life. Discrete queues exist in such different situations as collecting eggs in an old-fashioned farm-yard (where a queue can simulate the difference in time between eggs being laid and gathered), highway accident victims waiting for ambulances, and airplanes waiting for clearance to take off.

Some systems can be simulated by either a discontinuous or a continuous model. Our SPACE LANDING SIMULATION lets you try to land a spacecraft on the moon. This program waits for an input before continuing (you type in a number between zero and nine, representing "thrust"). If the program did not wait for your key press, but kept going through its operational cycle over and over again, checking the keyboard during each cycle, and making changes *only if* it detected a valid key press, the simulation would clearly be a continuous one. There would be no instant when the velocity and position of the craft were not changing. Add a real-time control facility to our FLIGHT SIMULATION program, and you'd have another non-discrete simulation.

In the next chapter of this book, we'll look at the basic elements of a simulation, and show how to break down a problem so that you

can create a simulation of it. The later chapters explore many different types of simulations. You'll see a number of simulation techniques in action, and can study the programs to see how the results were achieved. The lessons you learn from these chapters can then be applied to help you create your own simulations.

Chapter three looks at loops and feedback, the fundamental elements of all simulations, and shows these in action with the SPACE LANDING SIMULATION program. From there we move to Monte Carlo simulations, where the effects of random inputs on a system are discussed. Chapter five presents the predator/prey simulation, where simultaneous equations model the interaction of two kinds of cells living within a culture medium, and competing for the right to survive.

The next chapter presents a version of John Conway's classic computer simulation LIFE, where birth and death occur in a less bloodthirsty way than in our predator/prey simulation. The first version of this program allows you to encode game-starting patterns as DATA statements, so that different evolutionary outcomes can be studied. Then you'll shown how to make the simple changes that allow your computer to generate the starting colony at random.

Chapters seven, eight, and nine, which look at robot simulations, are considerably more ambitious than the earlier ones. In these chapters, we will actually examine two simulations at once. First, we simulate the action of a computer language interpreter, which "understands" commands entered in RCL, a new computer language (Robot Control Language). Second, the programs use RCL commands to move a little "robot," which leaves Logo-like designs as it trundles around your computer's screen. The programs given here form a solid basis for developing your own complete "turtle graphics" program.

Artificial intelligence is one of the "hot" areas of computer science at the moment, and this book would not be complete without a program or two that showed how a simulation program can apparently endow a computer with intelligence. Chapter ten lets you attempt the fairly fruitless task of trying to beat your computer at the game CONNECT FOUR, and explains how the program assesses its "best" move. The move-selection technique can be adapted to many other board games. The following chapter introduces a program that replicates an 1890 Spanish machine that plays a particular chess endgame. The Quevedo Chess Machine was probably the first genuine attempt to produce a chess-playing machine, so it is appropriate that it is represented here.

From chess we move into the political arena, and show how the economy of the United States can be (admittedly very crudely) mod-

eled within a computer simulation. You take the role of the President, and your job is to try to control the economy. You may well have a deeper sympathy for the real occupant of the Oval Office after you find your best efforts blowing up in your face.

Money manipulation lies at the heart of chapter thirteen's simulation of a small stock market in action, as you invest in the fluctuating fortunes of five companies, trying to reach a financial goal you have set for yourself. If you find you have considerable skill in this area, you can see if it stands you in good stead in manufacturing. DETROIT CITY, presented in chapters fifteen and sixteen, confronts you with an even more difficult challenge. Your task is to try to bring an ailing automobile manufacturing company back to a more profitable life. Fail, and you're out of a job. Succeed, and you get a seat on the board.

We move from the world of business simulations to programs that simulate leisure activities. GRIDIRON, presented in chapters seventeen and eighteen, puts you up against the computer-controlled Silicon Cowboys, or you can use the program to mediate a clash between two human beings. The next program gives you the chance to play a three-set game of tennis against your computer. Again, if you prefer, you can use the simulation simply to keep track of the action, and play against another flesh-and-blood opponent.

In chapters twenty-one and twenty-two, you are at the wheel of a racing car, as you try out your driving skill on your choice of Grand Prix tracks in Britain, Germany, Italy, or Monaco. The tracks used within the program are based on the real-life tracks, but I doubt whether the skills you pick up here could very usefully (or safely) be transferred to genuine Grand Prix driving on those circuits.

Finally, in chapters twenty-three and twenty-four, we have our *simulation de resistance*, a complete flight simulator. The program simulates an airplane that is fiendishly difficult, but not impossible, to fly. You'll find that keeping track of four or five constantly changing factors at once will take all your concentration. But the satisfaction you'll feel on your first successful landing will make it all worth while.

As you can see, we have some fascinating territory ahead of us. Let's go.

---

# 2

---

## The Components of a Simulation

In the simplest terms, a simulation is a computer model of cause and effect. Event A is linked to event B by equation X. Modify B, and C is affected, by linking factor Y. And so on. Isolate the links (X and Y, in the preceding examples), and you have the raw ingredients of a simulation.

If you turn on a light switch, electricity will flow through the circuit, and the light will come on. Cause and effect are easy to see in this situation:

CAUSE ----->	EFFECT ----->	EFFECT
SWITCH ON	CURRENT FLOWS	LIGHT GLOWS

It would be, of course, a trivial exercise to write a program to simulate the result of turning on a light switch. However, this should not blind us to the fact that, in essence, all simulations—no matter how complicated—that you write will show a clear linking between causes and effects.

### More Complex Links

The links, of course, will not always be this simple and straightforward.

Some effects may only come into play when variables reach trig-

ger values. For example, the car engine in our GRAND PRIX simulation blows up if the engine temperature exceeds 200 degrees. Your own simulations may have a link that looks like this:

EVENT X leads, if A is present, to EVENT Y  
EVENT X leads, if B is present, to EVENT Z

Analyze the links and express them in a diagram like the above, perhaps substituting mathematical formulas for our "if A, then B" links, and you're well on the way to writing your own simulation program.

The first simulation program in this book (in the next chapter) puts you in the position of a pilot trying to land your spacecraft on the moon. The causal links in this program are reasonably straightforward, but still manage to produce very interesting and somewhat unpredictable outcomes.

Here are the links. THRUST is the input from the user, each time through the loop.

```
+-----> FUEL = FUEL - THRUST
: IF FUEL = 0 ----->----->-----+
: VARIABLE FLAG (VF) = THRUST - 2 : 
: HEIGHT = HEIGHT + VELOCITY + VF/4 : 
: VELOCITY = VELOCITY + VF : 
: V
: IF HEIGHT < 10 ----->----->-----+
-----<-----<--GOTO NEW THRUST INPUT : 
: V V
IF VELOCITY > -9 AND VELOCITY < 5 THEN LAND SUCCESSFULLY : 
ELSE -----+ : 
: CRASH -----<-----+ : 
```

Although this may look a little complex at first sight, it is actually fairly simple. You can see that the causal loop diagram looks pretty much like a flow chart, and actually contains some lines that apparently could be programmed directly. When you look at the program (especially lines 170 to 240) you'll see that some of the lines above do appear almost unchanged in the program.

## Feedback

Causal loops contain elements, or processes, that interact. They also contain feedback mechanisms. The results of one series of computations (in the moonlander simulation, for example, the results are the height, velocity, and fuel left) feed back to affect the next input (THRUST in this case). In this case the feedback is presented to the

user on the screen. The user, or player, then makes choices about his next input. In continuous simulations, the feedback information can be used by the program to automatically influence the state of the simulation.

In real life, feedback influences many situations, for example, in the operation of a thermostat on a room heater. If the room gets colder, the thermostat turns the heater up. When the room becomes warmer, the thermostat turns the heater down. In due course, the room cools, the temperature drops, and the cycle begins again.

Feedback does not always lead to a fluctuating output. For example, if I am angry with you, I may raise my voice. You shout back. I am further angered by you raising your voice and I raise my voice some more. You, in turn, are made more angry by my increased volume, and shout even more loudly at me. A *self-reinforcing* loop is set up. If the heater's thermostat was set so that the hotter the room became, the more heat was produced, a similar self-reinforcing feedback loop would be seen (and felt!).

## **Equilibrium Points**

Many feedback loops have an *equilibrium point*. (In our thermostat example, the equilibrium point is the final steady temperature of the room.) A good simulation may, in effect, challenge the program user to discover that equilibrium point. There may well be, for example, a thrust input built into our moonlander program that allows the craft to sink gently down into the lunar dust.

## **Negative and Positive Loops**

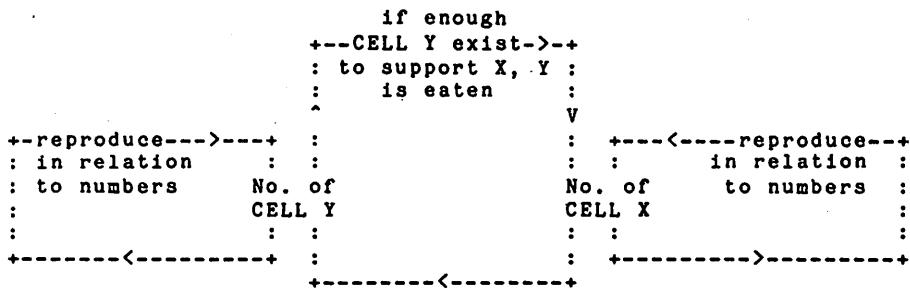

A *negative* feedback loop tends to push the system toward an equilibrium point. (As the room gets hotter, the thermostat turns the heater down.) A *positive* feedback loop tends to lead to dramatically accelerating or decelerating rates, pushing the system away from an equilibrium point. (As the room gets hotter, the heater is turned up more.)

It is fairly easy to understand how a single feedback loop can form the heart of a simple simulation. However, most situations in real life, when analyzed, turn out to be made up of more than one feedback loop.

For example, in the predator/prey simulation in chapter five, we have two life forms whose survival is inextricably bound together. If one species dies out, the other will also die. If there are too few predators, the number of prey will increase, leading to more food, so more predators are born. These in turn will eat more prey. The situation is

**dynamic, constantly changing as the simulation produces and uses its own feedback.**

Here is how chapter five's program looks in a causal diagram:

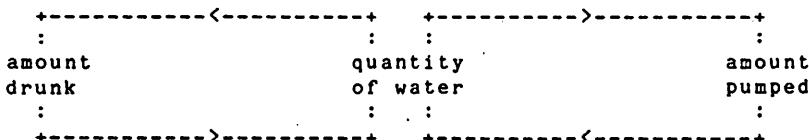

A situation like this can either stabilize, or can move so that either X or Y becomes dominant, with the other type of cell reduced to an ineffectual level.

Such simulations are fascinating to run, and their outcomes can be difficult to predict, even when you know the linking formulas well. In a simulation like this, where there are two negative feedback loops in operation, X and Y fluctuate about an equilibrium point as they act on each other.

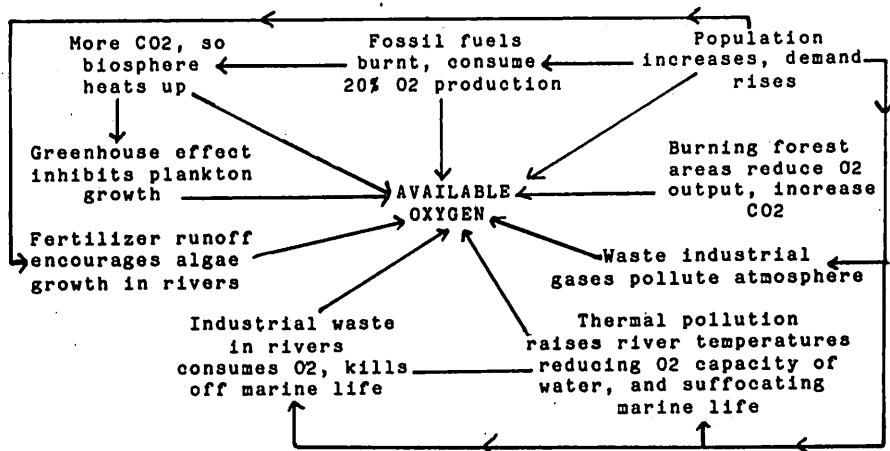

Your own simulation programs will be easier to write if you consider the behavior of the system you want to model in terms of positive or negative feedback loops.

Some relationships are easier to see than others. For example, this diagram shows the relationship between the work involved in pumping water from a well, the thirst produced by that work, and the amount of water produced:

This is a fairly clear situation, one that is probably simpler than any real-life situation you'll try to model with a simulation system. If a double loop is needed to show the relationship of something simple like this, it is highly likely that the systems you'll want to simulate will need two, or more, interacting loops.

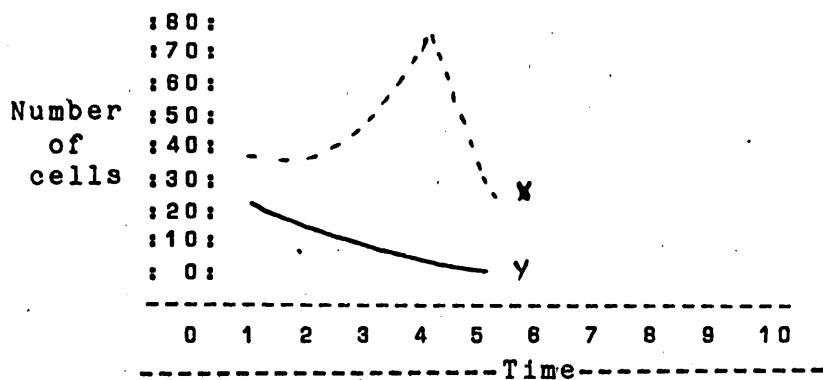

For example, the ecological system of oxygen use and replenishment on Earth can be shown with the following diagram:

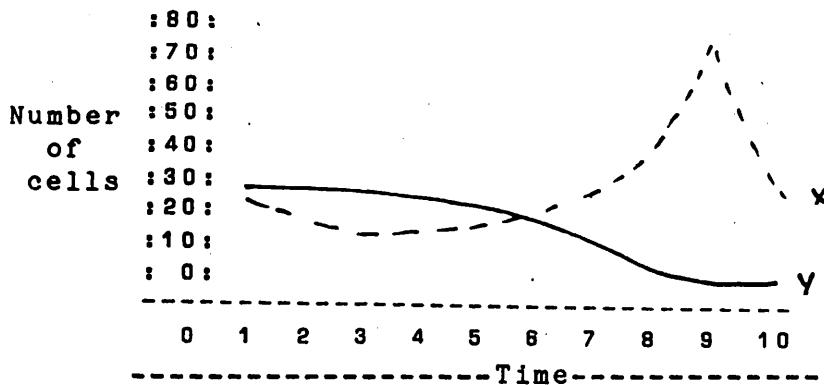

### Time Against Action

You may well find that producing a graph of the action of the system makes it easier to understand both the dynamics of the system and the causal loops that are acting within it.

If we plot against time the populations of cell type X and cell type Y from the runs of chapter five's predator/prey simulation, we get graphs like these:

These graphs show dramatically how the two life forms are related. The crossover points of the lines also suggest where the equilibrium points of the system may be.

So the causal loop diagrams help us find the underlying relationships within the system we hope to simulate, and a graph of the outputs of the simulation plotted against time allows us to see cause and effect in action within the system. This graphed data can help us to see the effectiveness or otherwise of our simulation, and helps our understanding of what is actually going on as the simulation runs.

You should now have enough background information to understand the processes involved in the creation and running of the simulation programs that make up the rest of the book. Once you get the programs up and running, you may well want to draw causal diagrams to show the links between elements in these programs. As well, the output from some—but not all—of the simulations can be graphed, to give further insight into the working of the system being modeled.

---

# 3

---

## Feedback in Action

In this chapter, we'll look at our first simulation program, one that has been around in one form or another since the earliest days of commercial computers. In those days, a lot of expensive corporate and academic computer time was consumed by would-be space pilots trying to land creaky old space ships on the moon.

Unlike the predator/prey simulations in chapter five, which use simultaneous equations, simulations like this one use a series of formulas held within a loop. After each run through the loop, the system operator receives feedback on the status of particular variables that are being modified (in this case, fuel, height, and velocity). On the basis of this feedback, the operator decides what input to enter, and then waits for the computer to report back on the result of processing that new input.

Here is how the series of mathematical operations is represented within the program loop. A\$ is the user input, signifying thrust.

```
160 THRUST=VAL(A$)+.1
170 FUEL=FUEL-THRUST
180 FLAG=THRUST-2
190 THRUST=0
200 HEIGHT=HEIGHT+VELOCITY+FLAG/4
210 VELOCITY=VELOCITY+FLAG
```

Typically, the main loop has certain exit conditions (such as, in this simulation, when you crash, run out of fuel, or manage to land safely) that abort the cycle and end the run with a status report to the operator. Lines 220 and 240 in the next section of the program check to see if the cycle should leave the loop, while 230 sends it back for another run through:

```
220 IF HEIGHT<=10 THEN 240
230 IF HEIGHT>10 THEN 120
240 IF VELOCITY>-9 AND VELOCITY<5 THEN 2
90
```

Of course, you don't need to know this, or keep it in mind, when running a program like the SPACE LANDING SIMULATION in this chapter. As far as you're concerned, you're trying to land your ship, and the mechanics of handling your input are none of your concern.

In this program user input is limited to choosing thrust. You signify a high thrust by pressing the "9" key; a low thrust with the "1" key; and zero thrust with the "0" key. Intermediate values are entered by touching other number keys. There is no need to press the RETURN or ENTER key at this point, as INKEY\$ (or GET\$) are used to read the keyboard.

Let's see how an unskilled pilot makes out when trying to land a spacecraft using this simulation:

FUEL	VELOCITY	HEIGHT
208.33	-11.42	497.03
208.23	-9.520001	507.99
208.13	-7.62	517.04
208.03	-5.72	524.2
207.93	-3.82	529.45
207.83	-1.92	532.8
207.73	-.02	534.26
207.63	1.88	533.81
207.53	3.78	531.47
207.43	5.68	527.22
207.33	7.58	521.07
188.23	10.48	341.57
178.13	3.38	332.87
170.03	-3.72	331.28

360 GOSUB 410
370 IF HEIGHT>=0 THEN END
380 IF HEIGHT<0 THEN PRINT "NEW CRATER O
N MOON"INT(ABS(100*(HEIGHT+.2)/3))/100" M
ETERS DEEP!"
390 PRINT "YOUR SKILL RATING IS "INT(100
*FUEL/(VELOCITY-HEIGHT))
400 END
```

```
410 PRINT "-----  
---"  
420 RETURN  
430 PRINT INT(100*FUEL)/100;  
440 PRINT TAB(12);-INT(100*VELOCITY)/100  
;  
450 IF HEIGHT>=0 THEN PRINT TAB(24);INT(  
100*HEIGHT)/100  
460 IF HEIGHT<0 THEN PRINT  
470 RETURN
```

Once you can land consistently with the program in its current form, change line 50 to the following, to create a whole new challenge:

```
50 FUEL=100+RND(1)*40
```

## Monte Carlo Simulations

*Monte Carlo simulations* are those simulations that depend on chance or random factors. The random elements in such programs may be weighted to simulate probabilities within specified limits (such as the results of throwing a pair of dice) or may be more or less genuinely random. In this chapter, you'll see a fairly "open" Monte Carlo simulation in action.

Our program is designed to simulate the effect of Brownian movement on a very small particle suspended in a fluid. The random motion of such a particle, which is observed when the particle is less than about one-thousandth of a millimeter in diameter, is caused by the impact of the atoms or molecules of the fluid on the particle. Brownian movement can be seen as smoke disperses in still air, or as ink is diffused in a tumbler of water. It's named after Robert Brown, a Scottish botanist who in 1827 first noted, but was unable to explain, the movement seen when looking through a microscope at a solution of pollen grains in water.

The simulation is shown on a 10 by 10 grid, with a single pollen grain, depicted by "0". When you run the program, you enter the position where you want the grain to start, and also set up a "goal" position. The simulation ends when the pollen grain reaches the goal position.

**Here's how it begins:**

**ENTER FIRST START CO-ORDINATE (LESS  
THAN 10)**

**? 3**

**ENTER SECOND START CO-ORDINATE (LESS  
THAN 10)**

**? 4**

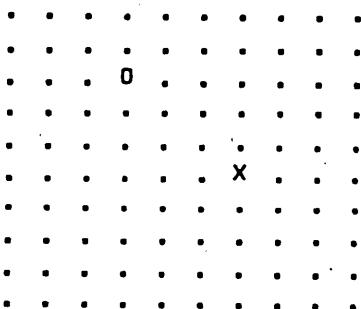

**ENTER FIRST END CO-ORDINATE (LESS  
THAN 10)**

**? 6**

**ENTER SECOND END CO-ORDINATE (LESS  
THAN 10)**

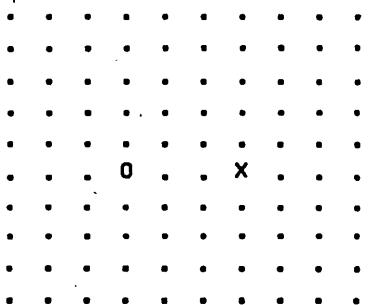

**? 7**

**MOVE 1**

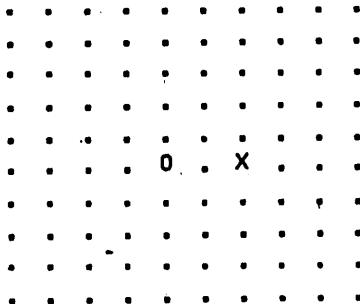

**And here are some screen printouts as the simulated Brownian  
movement makes the grain drift about:**

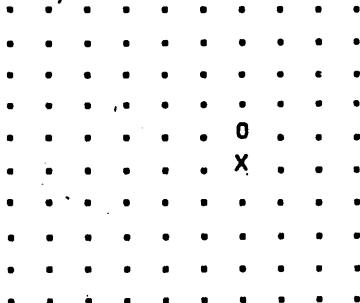

**MOVE 5**

**MOVE 9**

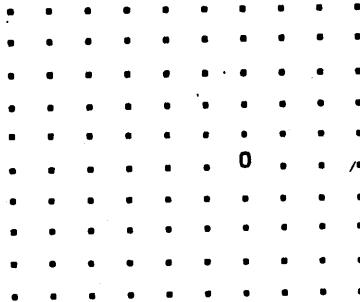

**MOVE 11**

**Finally, on the fourteenth move, the pollen grain reaches the target position, and the demonstration ends:**

**MOVE 14**

**DEMONSTRATION OVER**

Here's the listing so that you can explore this Monte Carlo demonstration:

## Simultaneous Equations

We can also create simulations that use simultaneous equations to show the effects of two interacting factors on each other. These equations are often used in predator/prey simulations like the one we'll examine in this chapter.

In this example, we have two forms of cell living in a culture. Both cells feed on nutrients in the culture medium, and attempt to reproduce as the simulation runs. Cell X also needs to consume cell Y in order to survive. If there are too many of cell X, it will kill off all of cell Y, and will then die itself. If there are none of cell X, cell Y will reproduce wildly, and choke the medium.

You are allowed to set the starting numbers of cells X and Y in each run of the simulation. You have to try and create a population balance that will allow the cell colony to survive for as long as possible. Although the *degree of aggressiveness* of cell X toward Y changes from run to run of the program (so that you can't just learn which numbers will always work), it does not change within a single run, so you can try various combinations to see how they behave.

The program starts by reporting the decay factor, which is the degree of aggressiveness cell X displays toward Y. It then asks you to enter the starting populations:

DECAY FACTOR IS .1408966

ENTER NUMBER OF CELL X TO  
START (LESS THAN 40)  
? 37

WE HAVE 37 X CELLS

ENTER NUMBER OF CELL Y TO  
START (LESS THAN 40)  
? 25

Once you've made your choice, the program works out the life history of your cell cultures, keeping you up to date:

-----  
TIME ELAPSED: 1  
37 CELL X  
25 CELL Y  
-----

TIME ELAPSED: 2  
35 CELL X  
17 CELL Y  
-----

TIME ELAPSED: 3  
46 CELL X  
9 CELL Y  
-----

TIME ELAPSED: 4  
77 CELL X  
2 CELL Y  
-----

```

YOUR CELL CLASH SIMULATION SURVIVED  
FOR 10 TIME PERIODS.

-----  
THE BEST SURVIVAL TIME SO FAR IS 10

-----  
DO YOU WANT A NEW RUN (Y OR N)?  
OK

The most crucial parts of the program are the equations that calculate the cell populations. These are lines 330 and 340:

```
330 CP=CP+[(8*CP-CP*EP/3)*FD]  
340 EP=EP+[(4*EP-EP*CP)*.01]
```

Modify parts of these program statements and watch the effect this has on the progress of your simulation. You'll probably be surprised

to see the far-reaching effects of even the most apparently minor change. Here's the listing:

```

---

## The Meaning of Life

In the previous chapter we looked at a program that simulated the action of two competing life forms occupying a single space. In that simulation, the growth and decay of the cells were governed by simultaneous equations. In this chapter, we'll look at two versions of a simulation classic, John Conway's LIFE. This simulation models the growth and development of a colony of cells living on a grid.

Developed by Conway when he was at Gonville and Caius College, in Cambridge, England, LIFE produces some amazing effects, whose richness is not even hinted at by the rules under which the cells live, reproduce, and die. To show this, we'll look at a colony of cells that starts off forming a square. This particular colony dies off after three "generations":

### GENERATION 1

XXXXX	XXXXX
X X	X X
X X	X X
X X	X X
XXXXX	XXXXX

## **GENERATION 2**

```
    XXX      XXX  
  XXXXX      XXXXX  
 XX X XX      XX X XX  
 XXX XXX      XXX XXX  
 XX ' X XX      XX X XX  
 XXXXX      XXXXX  
   XXX      XXX
```

## **GENERATION 3**

```
      X      X  
    X   X   X   X  
  X     X   X   X  
  
 X     X   X   X  
 X   X   X   X  
 X       X
```

**Another colony, which begins life in an "X" shape, evolves as follows (the program prints a "mirror image" colony to the right of the original colony in all these sample runs).**

## **GENERATION 1**

```
  X   X      X   X  
  X   X      X   X  
    X          X  
  X   X      X   X  
  X   X      X   X
```

**GENERATION 2**

XXX	XXX
X X	X X
XXX	XXX

**GENERATION 3**

A triangular pattern of 'X' characters forming a generation 3 fractal. The pattern consists of three rows of 'X's. The top row has one 'X'. The middle row has three 'X's. The bottom row has five 'X's, arranged in a triangle.

X
X X
X X X
X X
X

**GENERATION 4**

A more complex triangular pattern of 'X' characters forming a generation 4 fractal. The pattern consists of four rows of 'X's. The top two rows have one 'X' each. The middle row has three 'X's. The bottom row has five 'X's, arranged in a triangle.

X
XXX
XX XX
XXX
X

**GENERATION 5**

A highly detailed triangular pattern of 'X' characters forming a generation 5 fractal. The pattern consists of five rows of 'X's. The top three rows have one 'X' each. The middle row has three 'X's. The bottom row has five 'X's, arranged in a triangle.

XXX
X X
X X
X X
XXX

## GENERATION 6

```
      X           X  
    XXX         XXX  
   X X X       X X X  
XXX XXX     XXX XXX  
X X X       X X X  
XXX         XXX  
  X         X
```

## GENERATION 7

```
XXX       XXX  
  
X   X   X   X  
X   X   X   X  
X   X   X   X  
  
XXX       XXX
```

## GENERATION 8

```
      X           X  
    X           X  
   X           X  
  
XXX   XXX   XXX   XXX  
  
X           X  
X           X  
X           X
```

If we continue to run this simulation, each horizontal set of X's flips to become a vertical set, and the vertical sets become horizontal. This pattern of three alternating from horizontal to vertical is one of a number of patterns that regularly crop up in runs of the program. This particular pattern is commonly known as "traffic lights."

## The Rules

Conway's rules are not very complicated, but they are sufficient to give rise to the marvelous effects we've been looking at. They assume each cell has eight neighbors. (We keep the outermost ring of cells empty; these are checked, but not printed out.) If a cell has two or three neighbors, it survives to the next generation. If a cell has four neighbors, it dies out in the next generation due to overcrowding. If there are exactly three cells neighboring an empty cell, a cell is "born" in that location in the next generation.

The rules are applied simultaneously across the whole grid. We do this by having a second grid, which records the changes as the first grid is scanned. The second grid is then copied into the first before it is printed.

This is the listing that produced the effects above. The DATA statements at the end can be, of course, changed to whatever initial colony you desire:

## Colonies at Random

If you prefer to let your computer generate a starting colony at random, leaving you simply to admire its work, add the following lines:

```
555 IF RND(1)>.5 THEN A$(X,Y)="X":GOTO 5
70
595 GOTO 630
```

The evolution of a randomly generated colony is always fascinating to watch, as these sample runs indicate:

### GENERATION 1

```
    X   X   XXXXXXXXXX X   X
    X   XX   XX   XX   X
    X   X   X   XX   X   X   X
    X   XXXXXX   X
    X   XX   X
    X   X   X   X
    X   XX   XXXXXX   XX   X
    X   XXX   X   X   XXX   X
    X   XXXXXX   X
    XXX   XXXX
    XXXXXX   XX   XXXXXX
```

### GENERATION 2

```

## Robot Simulations

In this section of the book we will create programs that perform two simulations at once. First, the programs simulate the behavior of a robot who follows a series of commands we enter before the program is run. Second, the programs emulate a computer language interpreter, enabling the computer, and the computer-controlled robot, to understand instructions we give it in a *Robot Control Language* RCL, developed especially for this book.

In mid 1983 Muse Software, of Baltimore, released a superb robot simulation program under the name of *Robotwar*. This program allows you to pre-program a number of robots before setting them loose on a computer-screen battlefield to fight it out for victory. *Robotwar* allows you to program the robots in a language which is essentially English, with a few BASIC commands (such as GOTO and GOSUB) thrown in.

Our program, ROBOT LOGO and POINT-DUTY ROBOT (which is derived from the first program), are much simpler than *Robotwar*, yet still produce satisfying, and surprisingly interesting, results.

We'll look first at ROBOT LOGO. To show you what it can do, and to give you an idea of what an RCL listing looks like, here's a program that gets the robot to trace out my initials on the screen, leaving a trail as it goes:

```
GO 6,10
FACE 90
FORWARD 7
GO 8,26
FORWARD 5
PR
GO 6,16
FACE 180
FORWARD 6
GO 6,26
FORWARD 6
GO 6,34
FORWARD 6
PRINTOUT
*
```

This is the result of running that program:

X	X	X	X	X	X	X	X	X	X	X	X
X							X				X
X							X	X	X	X	X
X							X				X
X							X				X
X							X				X

There are twelve commands in RCL, any of which, included in a program, can be abbreviated to its first two letters. The RCL program is written into the overall BASIC program, as a set of up to twenty DATA statements, terminated with a DATA statement that just contains an asterisk. These DATA lines are kept near the beginning of the program. The current line being processed appears at the top of the screen as the program is running, so you can see the relevant line, and its effect, as it occurs.

## The Language

Here is the complete vocabulary of RCL:

**START (abbreviated to ST)** Start again.

**PRINTOUT (PR)** Stop the robot action, clear the screen, and print out the current situation before continuing with the program run.

**FORWARD (FO)** This is followed by a single number, and it tells the robot to move forward the number of "steps" or "spaces" indicated by the number that follows the command.

**BACK (BA)** The opposite, naturally enough, of FORWARD.

**TURN (TU)** Followed by a number, this command turns the robot through the specified number of degrees; it starts a run at zero degrees, designated as facing the top of the screen.

**HOME (HO)** Returns the robot to the center of the screen, facing upwards.

**CLEAN (CL)** Cleans the previous steps away. (The action of this command, like the others, will become clear once you use it.)

**GO** This is followed by two numbers, which are the coordinates to which the robot moves without leaving a trail between its old position and the new one.

**RANDOM (RA)** Moves the robot to a randomly chosen position on the screen; acts as a random GO.

**REPEAT (RE)** Followed by a number, this command allows you to cycle through a section of the program a specified number of times before continuing. This can produce some fascinating effects, as you'll see shortly.

**END REPEAT (EN)** Terminates the REPEAT cycle; all the commands in the RCL program that lie between REPEAT and END REPEAT will be cycled through the number of times specified.

**FACE (FA)** Followed by a number, this turns the robot to face an absolute angle, with the top of the screen as zero degrees (whereas TURN is relative to the current angle the robot is facing).

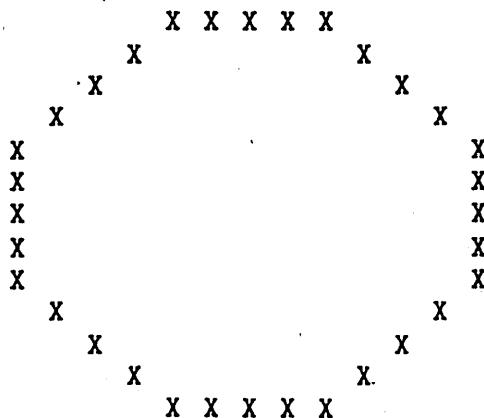

This short set of commands can be combined to produce many startling results. If you are at all familiar with the Logo programming language, you will recognize that several of the RCL commands are very similar to the turtle graphic commands in Logo. Logo was developed under Seymour Papert, with Marvin Minsky, Harold Abelson, and Andrew diSessa, at the Massachusetts Institute of Technology by the Artificial Intelligence Group. It was designed so that the way it was used by programmers would be closer to the way human beings usually solve problems, rather than being heavily influenced by how machines run programs. Of course, our RCL is pretty limited in comparison with Logo, although it can easily be extended to whatever level of complexity you like. Studying the listing will show you how it is relatively easy to write a program that *interprets* another program written in a language you have created.

Despite its limitations, you can have a lot of fun with RCL—as the following sample runs indicate.

**This RCL program produces octagons:**

**OCTAGON**

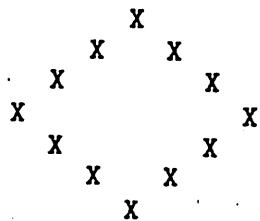

```
GO 11,35  
REPEAT 8  
FORWARD 4  
TURN 45  
END REPEAT  
PRINTOUT  
*
```

**You'll get diamonds with this one:**

**DIAMONDS**

```
RANDOM  
FACE 45  
REPEAT 4  
FORWARD 2  
TURN 90  
END REPEAT  
PRINTOUT  
START AGAIN  
*
```

**And this RCL listing creates squares:**

```
SQUARE
GO 11,35
REPEAT 4
FORWARD 6
TURN 90
END REPEAT
PRINTOUT
```

X X X X X X X  
X X X X X X X  
X X X X X X X  
X X X X X X X  
X X X X X X X  
X X X X X X X

**Descending triangles are easy. Note that we're using abbreviated commands in this RCL listing:**

The image shows a large, stylized letter 'G' formed by a grid of black 'X' characters. The 'G' is oriented vertically, with its bowl on the left and its stem extending downwards and to the right. The letters are arranged in a way that creates a textured, blocky appearance.

## **DESCENDING TRIANGLES**

GO	5,5
RE	6
FO	3
TU	135
FO	3
TU	135
FO	3
FA	90
FO	3
FA	180
FO	3
FA	0
PR	
EN	
#	

**The next RCL program gets our robot to walk down stairs:**

If you're feeling very creative, you can also get the robot to trace out pictures, like my initials earlier, or this "side view of a table":

A grid of 'X' marks arranged in a pattern that suggests a perspective view of a rectangular table. The 'X's are placed at the intersections of a grid, with more 'X's along the top and bottom edges and fewer in the center, creating a visual effect of depth.

SIDE VIEW OF TABLE

```
GO 20,50
FACE 315
FORWARD 9
FACE 90
FORWARD 10
FACE 225
FORWARD 10
PRINTOUT
```

## **Writing a Program**

**As I said earlier, the RCL program is held in a series of DATA statements near the beginning of the listing:**

```
100 REM ROBOT LOGO
110 GOSUB 1730:REM INITIALIZE
120 GOTO 480
130 REM ****
140 REM
150 REM
160 REM
170 REM
180 REM
190 REM
200 REM
210 REM
220 REM
230 REM
240 REM
250 REM
260 REM
270 REM
280 REM
290 REM
300 REM
310 REM
320 DATA " "
330 REM ****
```

**Here's a listing to create random octagons. We can learn a lot about RCL by examining it:**

```
OCTAGON

RANDOM
REPEAT 8
FORWARD 2
TURN -45
END REPEAT
PRINTOUT
START AGAIN
*
```

It begins with RANDOM, which moves the robot to a randomly chosen position on your screen. The dimensions of the screen are included within the program (see lines 1770 and 1780 in the listing in the next chapter), so it can be changed easily to work on your system no matter what its screen size.

Once the robot is in place, the computer comes to the line REPEAT 8. This tells it, naturally enough, that the next section of the program (down to the END REPEAT) is to be run through eight times. The robot moves FORWARD 2, then TURNS through 45 degrees. Once it has done this eight times, it has traced out an octagon, which PRINTOUT puts on the screen for you to see:

A 2D plot of an octagon formed by 'X' characters on a grid. The octagon is oriented with its vertices pointing towards the corners of the grid. It is composed of 16 segments, each consisting of two 'X' characters placed side-by-side. The plot is roughly centered on the grid.

A second 2D plot of an octagon formed by 'X' characters on a grid. This one is slightly smaller than the first and is also oriented with its vertices pointing towards the grid's corners. It is composed of 16 segments, each consisting of two 'X' characters placed side-by-side. The plot is roughly centered on the grid.

The final command, START AGAIN, sends action back to the first line of the program, to select a new random robot position. RCL automatically rejects values that are off the screen, so the program will not crash if you try to walk off the edge of the robot's world. It will simply draw the required material "off the screen," as it were, and then continue at the correct place when it returns to the screen.

From the examples we've looked at, you can see that the robot can be made to do a great deal. The biggest limitation is in the TURN and FACE commands. In its present form, it can only work in incre-

ments of 45 degrees, and will change any angle into the closest multiple of 45 before it sends the robot out along that path (see lines 1040 and 1620). This restriction was necessary in order to ensure that, despite the very rough resolution of the grid upon which the robot walks, a reasonable picture was still drawn by the robot's trail.

The full ROBOT LOGO listing is presented in the next chapter.

---

# 8

---

## The **ROBOT LOGO** Listing

You're sure to have a lot of fun using this listing to get the robot to follow programs you have devised. Simply place them, in the form of DATA "REPEAT 8", in lines 140 though to 310 (note the use of quotation marks around the RCL statement). Line 320, where you see a lone asterisk in the DATA statement, tells the program that it has come to the end of your listing.

I got my program listings to the printer by running the program, then entering and running the following directly:

```
FOR Z=1 TO 20:LPRINT A$(Z):NEXT Z
```

In its present form the program can cope with RCL programs that are up to twenty lines long. If you want it to accept longer programs, simply change the 20 in lines 530 and 1820 to the number of commands you want to include. Remember that you need to allow for a command slot to hold the asterisk (end-of-program flag) line.

Here, then, is the listing so that you can run your own robot:

```
100 REM ROBOT LOGO
110 GOSUB 1730:REM INITIALIZE
120 GOTO 490
```

## The Point-Duty Robot

While ROBOT LOGO is interesting as far as it goes, once I had used it for a while, I felt that it really didn't go far enough. The program was developed, like the others in this book, so they would run on just about any computer furnished with BASIC, and therefore used an array to keep track of the robot's movement and current position.

The POINT-DUTY ROBOT program that follows makes use of the PSET command included in the BASIC on my IBM PC to draw dots at a much finer resolution than the first program—320 by 200, rather than 80 by 24. Using a machine-specific command like PSET, of course means that if a listing of the program for your computer is not included in this book, you may have a little more trouble than usual in getting the program to run. However, the results are superb, and the effort involved in getting the program to run is certainly worth it. If your computer doesn't use PSET to plot a point on the screen, check your computer's BASIC manual for a similar command, such as SET, POINT, PLOT, that you can use as a replacement.

Here is the POINT-DUTY ROBOT listing, which is based on the ROBOT LOGO program in the previous chapter. It has not been renumbered, so you should find it easy to modify the first listing into the second one. The RCL commands are the same, except that PRINT-OUT is no longer supported. It is not needed, as the program prints out automatically as it is running.

Note that line 1735 in the listing that follows is an IBM-specific command that moves the computer into graphics mode. You will

need to drop or convert this line if you're running the program on a different computer.

There are many enjoyable programs you can write for your little robot to follow. As you can see from the FACE and TURN sections, the program supports angle changes of 17.5 degrees, rather than the coarser 45 degrees that was all the ROBOT LOGO could cope with.

When you have POINT-DUTY ROBOT up and running, you might like to try the following programs.

The first one is GLASS MAGNOLIA:

```
GO 100,170
REPEAT 5
FORWARD 13
TURN 72
END REPEAT
START AGAIN
*
```

Adding a single, additional line to that program produces CHURCH WINDOW:

```
GO 100,170
REPEAT 4
FORWARD 13
TURN 90
END REPEAT
TURN 22.5
START AGAIN
*
```

**HAMPTON COURT ROSE is an effective demonstration of the little robot in action:**

```
GO 100,170
REPEAT 2
FORWARD 3
TURN 22.5
FORWARD 6
TURN 22.5
FORWARD 9
TURN 22.5
FORWARD 12
TURN 22.5
FORWARD 12
TURN 22.5
FORWARD 7
TURN 90
END REPEAT
START AGAIN
```

\*

**RCL continues to amaze with SPIRAL NEBULA:**

```
GO 100,170
FORWARD 2
TURN 22.5
FORWARD 5
TURN 22.5
FORWARD 8
TURN 22.5
FORWARD 11
TURN 22.5
FORWARD 15
TURN 22.5
FORWARD 7
START AGAIN
```

\*

**CRAZY CRITTER** decorates your screen with something surprising:

```
GO 100,170
REPEAT 2
FORWARD 10
TURN 90
FORWARD 12
END REPEAT
TURN 22.5
START AGAIN
*
```

And this is **SIGNALMAN FREUD** (who worked for the Vienna Railroad Company):

```
GO 100,170
TURN 135
FORWARD 25
REPEAT 4
FORWARD 10
TURN 90
END REPEAT
START AGAIN
*
```

In our next program, **BUBBLES**, we use two REPEAT loops. Note these are not, and cannot be, nested, as RCL does not support nested loops:

```
RANDOM
REPEAT 16
FORWARD 2
TURN 25
END REPEAT
RANDOM
REPEAT 16
FORWARD 1
TURN 25
END REPEAT
START AGAIN
*
```

**Removing the second RANDOM line from BUBBLES turns the program into one I have called THE EYES ARE WATCHING YOU:**

```
RANDOM  
REPEAT 16  
FORWARD 2  
TURN 25  
END REPEAT  
REPEAT 16  
FORWARD 1  
TURN 25  
END REPEAT  
START AGAIN
```

\*

**From that we move to HAND ME DOWN MY DANCING CANE:**

```
RANDOM  
FORWARD 15  
TURN 315  
BACK 5  
TURN 22.5  
START AGAIN
```

\*

**And, finally, ONE-WAY STREET:**

```
RANDOM  
FORWARD 15  
TURN 315  
BACK 6  
FORWARD 6  
TURN 270  
FORWARD 6  
START AGAIN
```

\*

## Simulating Intelligence

An enormous amount of energy is now being spent to get computers to behave in ways that appear intelligent. Artificial Intelligence (AI) research has looked into many of the simple human exhibitions of intelligence, such as game playing. It has produced some highly creditable results—as shown by the current generation of chess machines. *Expert systems*, in which the computer uses the encoded expertise of human specialists to reach decisions and give advice, is another particularly fruitful area of AI development. Expert systems have been developed in a wide range of disciplines. They can now diagnose certain classes of diseases, assist in chemical synthesis, and help in the search for mineral deposits. The scope of AI research has broadened over the last twenty years and now also covers such topics as perception (vision and speech) and the understanding of human (natural) languages.

In this chapter, we'll concentrate on the game-playing side of artificial intelligence. The simulation we'll develop plays a very good game of CONNECT FOUR, in which two players take turns placing pieces in the lowest available position in the columns on a game board, trying to be the first to get four of their pieces to form a line in any direction.

It is interesting to note that computer programs that appear to display intelligence often work quite differently from the way human beings approach the same problems. Typically, computer systems analyze the tens of thousands of possible moves, ranking them hier-

achically, and choosing the best possible next move. Human players, on the other hand, appear to make their decisions almost intuitively. Human experts, although they may use some or all of the same raw data as an expert system working in the same field, do not examine every piece of information that could possibly be relevant before deciding which of the potential outcomes has the highest probability of being correct.

Similarly, in our artificial intelligence simulation program, the computer works out its moves in a manner that is quite alien to our own thinking. Despite this, it plays extremely well, and will prove a difficult, almost impossible, opponent to defeat. It assigns a value to each possible move, and then evaluates each of these moves in terms of whether this will help win the game. It then selects the move with the best potential.

When you're making your own moves, you're far more likely to just look at the board, check whether there is any danger of the computer completing a row of four, and if so, attempt to block it, or select a move that "feels" as though it could help lead you to victory.

The lesson is clear. When writing your own artificial intelligence programs, look for the end result you want to achieve, rather than trying to emulate your own thinking processes.

Let's look at our CONNECT FOUR program in action. You enter your move as a number between one and eight, and the computer automatically places your piece (a small letter "o") at the lowest available position in the row designated by the number you have entered. The computer pieces are represented by the letter "M":

```
.....  
.....  
.....  
.....  
.....  
.....  
.....  
1 2 3 4 5 6 7 8
```

YOUR MOVE...

## The Quevedo Chess Machine

The first recorded attempt to produce a machine that would play chess was made in Spain in 1890. The scientist Torres y Quevedo produced a little device that would play the end game of a king and rook against a king, taking the side with the rook. The machine was always able to force mate.

After reading about Quevedo's machine in David Levy's fascinating book *Chess and Computers* (Computer Science Press, Inc., Potomac, Maryland; 1976), I decided to try and write a program that would simulate the machine's behavior. The machine can move in one of six possible ways. This program reports which of the six moves it has used on each turn.

You'll find that the computer makes a rapid assessment of the situation. Here is an example of the program in action. You play the single king (the "S" sign). The computer's king is the "K" and its rook is the "R":

## Into the Political Arena

As we discussed earlier, computer programs can also be used to simulate any process where the links between elements of the process can be expressed as one or more mathematical relationships. The political simulation in this chapter, WASHINGTON, D.C., shows this very clearly. It's governed by mathematical relationships that represent a grossly over-simplified version of the American economy.

You take the role of the hapless occupant of the Oval Office, running—as you'll soon see—an economy that is somewhat out of kilter. To retain your popular support (and the Presidency) you have to try to keep the whole thing together. You need to do your best to improve the standard of living, keep inflation and unemployment down, stimulate private investment, and generally maintain an acceptable growth in the economy, all at same time. You'll discover that a President's lot is not a happy one.

The simulation begins with a report on the state of the nation:

PRESIDENT HARTNELL:  
YOUR ADMINISTRATION HAS BEEN IN  
POWER FOR .25 YEARS

-----  
----- STATE OF THE NATION -----  
-----

POPULATION 3000819  
NO. UNEMPLOYED 300000 9 %

CURRENT WAGES \$ 100 INFLATION 5 %  
GOVT. EXPENDITURE LAST QTR. \$M 118  
UNEMPLOYMENT COST \$M 0  
INCOME FROM TAXES \$M 0  
BUDGET SURPLUS(+) / DEFICIT(-) \$M 0  
GROSS DOMESTIC PRODUCT \$M 440

-----  
PUBLIC INVESTMENT Q 1 \$M 236  
-----

You start each run with a population of around 3,000,000 and an unemployment rate of about 10%. You are then asked to make some snap judgments on levels of government spending, cost of wages, and on your administration's immigration policy:

OK, PRESIDENT HARTNELL...  
ENTER GOVERNMENT SPENDING \$M? 102  
ENTER COST OF WAGES \$M? 41  
IS YOUR ADMINISTRATION IN FAVOR OF  
IMMIGRATION THIS QUARTER (Y/N)?  
OK...N

At the end of my second quarter in office, I found that while I had somehow kept inflation and unemployment under control, I was suddenly faced with a budget deficit of over \$69 million! On the positive side, public investment (and therefore, I hoped, public confidence) was on the increase, up from \$236 million at the end of the first quarter to more than \$257 million at this point. I decide to increase spending slightly:

PRESIDENT HARTNELL:  
YOUR ADMINISTRATION HAS BEEN IN  
POWER FOR .5 YEARS

-----  
-----STATE OF THE NATION-----  
-----

POPULATION 3001638  
NO. UNEMPLOYED 287879 9 %  
CURRENT WAGES \$ 41 INFLATION 9 %  
GOVT. EXPENDITURE LAST QTR. \$M 102  
UNEMPLOYMENT COST \$M 11.8  
INCOME FROM TAXES \$M 44.4  
BUDGET SURPLUS(+) / DEFICIT(-) \$M -69.4  
GROSS DOMESTIC PRODUCT \$M 449.2

-----  
PUBLIC INVESTMENT Q Q 2 \$M 275.7  
-----

OK, PRESIDENT HARTNELL...

ENTER GOVERNMENT SPENDING \$M? 107

ENTER COST OF WAGES \$M? 43

I also decide to let a few of the world's tired and hungry masses into the land of milk and budget deficits:

IS YOUR ADMINISTRATION IN FAVOR OF IMMIGRATION THIS QUARTER (Y/N)?

OK...Y

HOW MANY IMMIGRANTS WILL YOU ALLOW INTO THE US?

? 1000

At the end of my first year, the deficit has grown to \$216 million, and standard of living has increased by 12%:

YOUR ADMINISTRATION HAS BEEN IN POWER FOR 1 YEARS

-----  
STATE OF THE NATION-----

POPULATION 3004277

NO. UNEMPLOYED 272309 9 %

CURRENT WAGES \$ 46 INFLATION 9 %

GOVT. EXPENDITURE LAST QTR. \$M 111

UNEMPLOYMENT COST \$M 12.5

INCOME FROM TAXES \$M 50.2

BUDGET SURPLUS(+) / DEFICIT(-) \$M -216.7

GROSS DOMESTIC PRODUCT \$M 486.2

CHANGE IN LIVING STANDARD 12 %

-----  
PUBLIC INVESTMENT Q Q 4 \$M 364.4  
-----

OK, PRESIDENT HARTNELL...

ENTER GOVERNMENT SPENDING \$M? 120

ENTER COST OF WAGES \$M? 65

IS YOUR ADMINISTRATION IN FAVOR OF IMMIGRATION THIS QUARTER (Y/N)?

OK...N

I stumble on, narrowly avoiding disasters each time I turn my head. Things start getting really hairy toward the end of my second year in office:

PRESIDENT HARTNELL:

YOUR ADMINISTRATION HAS BEEN IN  
POWER FOR 1.75 YEARS

-----

-----STATE OF THE NATION-----

-----

POPULATION 3008238

NO. UNEMPLOYED 377324 12 %

CURRENT WAGES \$ 66 INFLATION 12 %

GOVT. EXPENDITURE LAST QTR. \$M 125

UNEMPLOYMENT COST \$M 24.9

INCOME FROM TAXES \$M 69.4

BUDGET SURPLUS(+) / DEFICIT(-) \$M -436.8

GROSS DOMESTIC PRODUCT \$M 866

CHANGE IN LIVING STANDARD 13 %

-----

PUBLIC INVESTMENT 1 Q 3 \$M 243.2

-----

OK, PRESIDENT HARTNELL...

ENTER GOVERNMENT SPENDING \$M? 126

ENTER COST OF WAGES \$M? 67

The outcome is inevitable. My time is up:

PRESIDENT HARTNELL, YOUR  
ADMINISTRATION'S POOR ECONOMIC  
PERFORMANCE HAS LED TO AN UNACCEPTABLE  
RISE IN UNEMPLOYMENT

AMONG OTHER THINGS...

-----

THE LACK OF CONFIDENCE IN YOUR  
ADMINISTRATION IS SO BAD THERE ARE  
CALLS FOR YOU TO RESIGN...YOU STEP  
ASIDE TO ALLOW THE VICE-PRESIDENT TO  
OCCUPY THE OVAL OFFICE

-----

YOU WERE PRESIDENT FOR 2.25 YEARS  
DURING YOUR TERM OF OFFICE, THE  
POPULATION ROSE BY 9059

THE UNEMPLOYMENT RATE BECAME 17 %  
AND THE INFLATION RATE BECAME 17.4 %  
STANDARD OF LIVING CHANGED BY 17 %  
AND THE BUDGET SURPLUS/DEFICIT  
WAS \$M-597.5

This is a program you may well enjoy modifying. For example, changing the income you get from taxes, will alter the simulation in a radical way. You can also fiddle with the thresholds at which the public starts waving their fists.

Line 50 governs the increase in population from quarter to quarter. A steeper increase here will make it harder to keep the lid on unemployment.

I've been pretty generous with my use of REM statements in this program, so you should find it relatively easy to track down the variables you'd like to modify. Here are the major ones, as listed in the initialization section of the program:

```
1150 REM ****
1160 REM INITIALIZATION
1170 CLS
1180 RANDOMIZE VAL(RIGHT$(TIME$,2))
1190 ML=1000*1000
1200 P=3*ML:REM POPULATION
1210 U=P/10:REM UNEMPLOYMENT
1220 IV=236:REM INVESTMENT
1230 GE=118:REM GOVERNMENT EXPENDITURE
1240 GU=0:REM COST OF UNEMPLOYMENT
1250 GI=0:REM INCOME FROM TAXES
1260 WN=100:REM NEW WAGES
1270 WO=100:REM OLD WAGES
1280 IP=5:REM INFLATION PERCENT
1290 GDP=440:REM GROSS DOMESTIC PRODUCT
1300 AGDP=440:REM BASE YEAR GDP
1310 RGDP=440:REM REAL GDP
1320 CN=354:REM ECONOMIC CONSTANT
    (USED THROUGHOUT SIMULATION)
1330 Z=1:GAME=0:FLAG=0
1340 Y=0:REM YEAR
1350 PRINT "ENTER YOUR LAST NAME"
1360 INPUT A$
1370 RETURN
```

The part of the program that does all the calculating is also fairly easy to unravel, once you know the principal variables:

```
490 REM ****
500 REM CALCULATIONS
510 CN=CN+[CN*IP/100]
520 U=P*{GE+IV}/[CN*10]+P*[IP/1000]
530 GU=U*WN/ML:REM UNEMPLOYMENT COST
540 GI={[{P-U}*WN*.4]/ML}:REM INCOME
                                FROM TAXES
550 BD=BD+GI-GU-GE:REM BUDGET DEFICIT
560 AGDP=AGDP*[1+(IP/100)]
570 GDP=GE+IV+[{P-U}*WN/ML]
580 RGDP=GDP*440/AGDP
590 IP=[{GE+IV}/CN*.1+[WN/WO]/100]*100
600 IV=[CN*67]/[IP*IP]
610 WO=WN
620 Z=Z+1:IF Z>4 THEN Z=1:Y=Y+1
630 RETURN
640 REM ****
650 REM CHECK BUDGET DEFICIT
660 IF BD>-1000 THEN RETURN
670 GAME=1
680 FLAG=1
690 RETURN
700 REM ****
710 REM CHECK STANDARD OF LIVING
720 IF Y<.75 THEN RETURN
730 IF INT[{2*[(RGDP/AGDP)*100]-100}/3]>
-15 THEN RETURN
740 GAME=1
750 FLAG=2
760 RETURN
770 REM ****
780 REM CHECK INFLATION RATE
790 IF IP<15 THEN RETURN
800 GAME=1
810 FLAG=3
820 RETURN
830 REM ****
840 REM CHECK UNEMPLOYMENT
850 IF INT[U*100/P]<15 THEN RETURN
```

```
860 GAME=1
870 FLAG=4
880 RETURN
890 REM *****
```

Here is the complete listing of the WASHINGTON, D.C. program:

```
10 REM WASHINGTON D.C.
20 GOSUB 1160:REM INITIALIZE
30 REM ****
40 REM MAJOR CYCLE
50 P=INT(P+(P*273/ML))

## **Playing the Stock Market**

The numbers that a computer manipulates can represent anything—cloud density, intricate subatomic reactions within a complex chemical experiment, or the number of warriors taking part in a Roman raid on an English village. When computers were first used in business, the numbers generally stood for more mundane things like statistics, sales, and dollars. In the simulation in this chapter, we'll stick to the extremely important, if mundane, subject of money.

You play a broker dealing in a small market of five companies. You start the simulation with \$15,000 and are asked to enter a financial target for the run:

ENTER YOUR GOAL FOR THIS SIMULATION,  
\$16,000 TO \$100,000

? 250000  
TOO HIGH!

ENTER YOUR GOAL FOR THIS SIMULATION,  
\$16,000 TO \$100,000  
? 16000

Once you've done that, the starting state of the market is revealed:

---

DAY 1            YOUR GOAL IS \$ 16000

---

COMPANY NUMBER:

1	2	3	4	5
---	---	---	---	---

CHANCE OF INCREASE (%):

23	59	28	59	41
----	----	----	----	----

CHANCE OF DECREASE (%):

31	26	55	8	17
----	----	----	---	----

CURRENT VALUE PER SHARE:

\$ 1.49 \$ 1.99 \$ 2.49 \$ 2.99 \$ 3.49

NO. OF SHARES HELD:

2000	1500	1200	1000	800
------	------	------	------	-----

BANK \$ 265 TOTAL WORTH \$ 15000

---

DO YOU WANT TO SELL ANY SHARES (Y/N)?

One cycle of buying and/or selling represents a day of trading. Each day, you are told the chance of each share rising or falling in price. Based on that information, you can decide what to buy or sell:

---

DAY 1            YOUR GOAL IS \$ 16000

---

COMPANY NUMBER:

1	2	3	4	5
---	---	---	---	---

CHANCE OF INCREASE (%):

23	59	28	59	41
----	----	----	----	----

CHANCE OF DECREASE (%):

31	26	55	8	17
----	----	----	---	----

CURRENT VALUE PER SHARE:

\$ 1.49 \$ 1.99 \$ 2.49 \$ 2.99 \$ 3.49

NO. OF SHARES HELD:

2000	1500	1200	1000	800
------	------	------	------	-----

BANK \$ 265 TOTAL WORTH \$ 15000

---

WHICH ONES TO SELL?      OK 1

HOW MANY OF 1 TO SELL? 3000

YOU DON'T HAVE THAT MANY!

? 1500

---

DAY 1            YOUR GOAL IS \$ 16000

---

COMPANY NUMBER:

1	2	3	4	5
---	---	---	---	---

CHANCE OF INCREASE (%):

23	59	28	59	41
----	----	----	----	----

CHANCE OF DECREASE (%):

31	26	55	8	17
----	----	----	---	----

CURRENT VALUE PER SHARE:

---

WHICH COMPANY TO BUY?    OK 4

HOW MANY OF 4 TO BUY? 750

You can only sell and buy shares once each day, so you must choose wisely. After you've made your decisions, the computer will tell you how you rate as a stockbroker. Some of the assessments, as I'm sure you'll discover, can be quite harsh:

---

DAY 2            YOUR GOAL IS \$ 16000

---

COMPANY NUMBER:

1	2	3	4	5
---	---	---	---	---

CHANCE OF INCREASE (%):

51	11	43	32	35
----	----	----	----	----

CHANCE OF DECREASE (%):

49	43	8	49	46
----	----	---	----	----

CURRENT VALUE PER SHARE:

\$ 1.49 \$ 2.1 \$ 2.36 \$ 3.16 \$ 3.49

NO. OF SHARES HELD:

600	1500	1200	1750	800
-----	------	------	------	-----

BANK \$ 108 TOTAL WORTH \$ 15329.06

---

YOUR RATING AFTER THAT ROUND OF  
TRADING IS 'BAD'

<PRESS SPACEBAR TO CONTINUE >

However, if you persevere, you may well prosper in the end. Just don't allow yourself to be discouraged by assessments such as "hopeless":

---

If you want to modify the degree of difficulty of this simulation, change the 55 in line 170. The lower the number (down to 30), the easier it is to make a profit. The higher the number,(up to 80), the more difficult it becomes. The simulation will not run even remotely realistically if you use values less than 30, or greater than 80, in line 170.

---

# 15

---

## **Running an Automobile Company**

The complex processes of manufacturing and sales are presented, albeit in a very simplified form, in this simulation. It took sixty years for the automobile market to become saturated in the United States. You have been unfortunate enough to be appointed as president of a major car manufacturing concern the very same month that the car market really hits bottom. To save the day—and your reputation as a hard-hitting, straight-from-the-shoulder, trouble-shootin', crisis-solvin' executive—you must get the tottering firm back on its feet.

You take over just as the accountants announce that the company is losing \$60 million a year. Your task, needless to say, is to try and make the company profitable.

Here's how it begins:

INDUSTRY SALES 50000 IN MONTH 0

---

YOU HAVE 12000 EMPLOYEES  
AVERAGE WAGES ARE \$ 22995  
OR \$M 22.9 PER MONTH

---

As you can see, the total sales within the automobile industry for the month before the simulation began (month 0) were 50,000

units. You start the simulation with your company holding about a quarter of the total industry sales, or around 12,500 vehicles. You have four factories, which are currently producing more vehicles than you can sell:

-----  
MAXIMUM MONTHLY OUTPUT:

FACTORY 1: 8900

FACTORY 2: 3250

FACTORY 3: 2500

FACTORY 4: 1625

-----  
TOTAL OUTPUT IS 16275  
-----

EFFICIENCY LEVEL IS 77 %

DO YOU WANT TO EXPAND OUTPUT (Y/N)?

N

DO YOU WANT TO SELL FACTORY 4 (Y/N)?

N

When the simulation begins, the average annual wage for each employee is around \$23,000. This will rise each three months, due to union demands for adjustments to keep up with inflation. Although you cannot reduce wages, or refuse to include the raise due to inflation, you can decide how many people to hire or fire, and at what price you will sell each vehicle. When the simulation begins, each car sells for around \$12,000:

INDUSTRY SALES 50000 IN MONTH 0

-----  
YOU HAVE 12000 EMPLOYEES

AVERAGE WAGES ARE \$ 22995

OR \$M 22.9 PER MONTH

-----  
HOW MANY EMPLOYEES TO HIRE? 0

HOW MANY EMPLOYEES TO FIRE? 567

-----  
YOU HAVE 11433 EMPLOYEES

AVERAGE WAGES ARE \$ 22995

OR \$M 21.9 PER MONTH

-----  
WHAT IS YOUR SELLING PRICE? 12345

Once you've answered all the relevant questions, the simulation reports back to you on how well—or otherwise—you have performed:

INDUSTRY SALES 48833 IN MONTH 1  
YOUR SALES: 13386 [ 27.4 % OF TOTAL ]

-----  
YOU HAVE 11433 EMPLOYEES  
AVERAGE WAGES ARE \$ 22995  
OR \$M 21.9 PER MONTH

-----  
AVERAGE COST PER VEHICLE IS \$ 10192  
AND AVERAGE SELLING PRICE IS \$ 12345  
SO THE AVERAGE PROFIT IS \$ 2152  
OR \$M 28.8 PER MONTH

-----  
PROFIT FOR THE MONTH IS \$M 6.9  
& TOTAL PROFIT TO DATE IS \$M 6.9

-----  
DO YOU WANT TO RESIGN (Y/N)?  
N

That wasn't too bad. You actually made a profit.  
The process continues:

INDUSTRY SALES 48833 IN MONTH 1  
YOUR SALES: 13386 [ 27.4 % OF TOTAL ]

-----  
YOU HAVE 10233 EMPLOYEES  
AVERAGE WAGES ARE \$ 22995  
OR \$M 19.6 PER MONTH

-----  
AVERAGE COST PER VEHICLE IS \$ 10192  
AND AVERAGE SELLING PRICE IS \$ 12345  
SO THE AVERAGE PROFIT IS \$ 2152  
OR \$M 28.8 PER MONTH

-----  
PROFIT FOR THE MONTH IS \$M 6.9  
& TOTAL PROFIT TO DATE IS \$M 6.9

-----  
WHAT IS YOUR SELLING PRICE? 24000  
TOO BIG A CHANGE FOR THE MARKET  
WHAT IS YOUR SELLING PRICE? 14000  
INDUSTRY SALES 51485 IN MONTH 2  
YOUR SALES: 6435 [ 12.5 % OF TOTAL ]

-----  
YOU HAVE 10233 EMPLOYEES  
AVERAGE WAGES ARE \$ 22995  
OR \$M 19.6 PER MONTH  
-----

AVERAGE COST PER VEHICLE IS \$ 11630  
AND AVERAGE SELLING PRICE IS \$ 14000  
SO THE AVERAGE PROFIT IS \$ 2369  
OR \$M 15.2 PER MONTH  
-----

PROFIT FOR THE MONTH IS \$M-4.4  
& TOTAL PROFIT TO DATE IS \$M 2.5  
-----

DO YOU WANT TO RESIGN (Y/N)?

N

Just when you think you're getting it all under control, inflation  
exacts its toll:

INFLATION RATE THIS QUARTER IS 2.5 %  
AVERAGE WAGES BILL WILL NOW RISE TO  
\$ 23569 PER EMPLOYEE

ANY KEY TO CONTINUE

Your next month is not very good:

INDUSTRY SALES 49184 IN MONTH 3  
YOUR SALES: 6837 ( 13.9 % OF TOTAL )  
-----

YOU HAVE 9743 EMPLOYEES  
AVERAGE WAGES ARE \$ 23569.88  
OR \$M 19.1 PER MONTH  
-----

AVERAGE COST PER VEHICLE IS \$ 11835  
AND AVERAGE SELLING PRICE IS \$ 14500  
SO THE AVERAGE PROFIT IS \$ 2664  
OR \$M 18.2 PER MONTH  
-----

PROFIT FOR THE MONTH IS \$M-1  
& TOTAL PROFIT TO DATE IS \$M 1.5  
-----

DO YOU WANT TO RESIGN (Y/N)?

You start the simulation, as you've seen, with four factories. You have the option of at any time selling off factory number four. Alternatively, you can increase the output of the factories. You'll find that the minimum cost per vehicle (and therefore the maximum profit per sale) occurs when your factories are running at 85% efficiency.

Let's decide to sell off factory four, to let the income from that sale offset our losses:

YOUR MONTHLY SALES ARE 5517

-----  
MAXIMUM MONTHLY OUTPUT:

FACTORY 1: 8800

FACTORY 2: 3250

FACTORY 3: 2500

FACTORY 4: 1625

-----  
TOTAL OUTPUT IS 16275

-----  
EFFICIENCY LEVEL IS 33 %

DO YOU WANT TO EXPAND OUTPUT (Y/N)?

N

DO YOU WANT TO SELL FACTORY 4 (Y/N)?

Y

FACTORY 4 IS VALUED FOR SALE AT \$104

YOU CAN'T REBUY IT LATER IF

YOU SELL IT...

DO YOU WANT TO SELL (Y/N)?

Y

I've tried this simulation several times. Each time, the same fate occurs. Perhaps I'm just not cut out to run a multi-million-dollar business:

INDUSTRY SALES 48891 IN MONTH 10  
YOUR SALES: 5727 [ 11.6 % OF TOTAL ]

-----  
YOU HAVE 9703 EMPLOYEES

AVERAGE WAGES ARE \$ 24521.51

OR \$M 19.8 PER MONTH

-----  
AVERAGE COST PER VEHICLE IS \$ 12418  
AND AVERAGE SELLING PRICE IS \$ 15400  
SO THE AVERAGE PROFIT IS \$ 2981  
OR \$M 17 PER MONTH

-----  
PROFIT FOR THE MONTH IS \$M-2.8  
& TOTAL PROFIT TO DATE IS \$M 68.4  
-----

DO YOU WANT TO RESIGN (Y/N)?

YOU JUST MADE YOUR TWELFTH MONTHLY  
LOSS IN A ROW.....

YOUR EMPLOYMENT  
IS HEREBY TERMINATED!!

A much better outcome is, however, possible for those who are  
more skilled than I am:

WELL DONE! THE COMPANY HAS MADE MORE  
THAN \$M200. YOU'VE BEEN MADE  
A MEMBER OF THE BOARD

Here are the principal variables, as they are assigned at the start  
of this simulation:

```
1630 REM ****
1640 REM INITIALIZATION
1650 CLS
1660 RANDOMIZE VAL(RIGHT$(TIME$,2))
1670 DIM M(5),Y(5)
1680 NE=12000:REM STARTING NO EMPLOYEES

## **Life at the Super Bowl**

It all started back in 1823, at a very upper class school in England. A Rugby School student, William Webb Ellis, was playing soccer one day when he picked up the ball, tucked it under his arm, and ran frantically across his opponent's goal. In this moment the game that later became rugby football was born. From rugby football came rugby league, and eventually GRIDIRON.

Some students from Harvard in 1874 saw the game, as it had then evolved, under way at Montreal University, and liked what they saw. They took some of the Montreal rules and used them to modify a soccerlike game that was already gaining favor in the States.

The game took off, but was so rough and caused so many injuries that at the turn of the century many colleges called for it to be banned. However, Teddy Roosevelt, who liked the game (and most other rugged sports), suggested that instead of banning it, the game should be made simpler. A committee formed of leading coaches, managers, and players met in 1906 to consider Roosevelt's suggestion, and from this committee came the GRIDIRON we know today.

In our program, you can either play against the computer team (known as the "Silicon Cowboys") or against another human being. In the game shown here, I decided to play against the computer:

ONE PLAYER OR TWO  
? 1

AND THE NAME OF THE VISITING TEAM?  
? HARTNELL'S RAIDERS

In this simulation, you have the option of throwing, carrying, or punting (including field goal attempts) the ball. The program allows for four fifteen-minute quarters, and tests your decision-making skills and reflexes.

THERE ARE 60 MINUTES TO GO  
SILICON COWBOYS TO KICK OFF  
YOU ARE ON YOUR OWN 35 YARD LINE  
SILICON COWBOYS HAVE...  
KICKED 1 YARDS  
KICKED 2 YARDS  
KICKED 3 YARDS

KICKED 52 YARDS  
KICKED 53 YARDS  
KICKED 54 YARDS  
KICKED 55 YARDS

THE BALL IS CAUGHT!  
AND RETURNED 1 YARDS  
AND RETURNED 2 YARDS  
AND RETURNED 3 YARDS

AND RETURNED 27 YARDS  
AND RETURNED 28 YARDS  
AND RETURNED 29 YARDS

-----  
THE BALL IS DOWN ON  
HARTNELL'S RAIDERS'S 39 YARD LINE  
> PRESS ANY KEY <

SILICO O HARTNE O  
60 MINUTES TO GO

-----  
HARTNELL'S RAIDERS IN POSSESSION  
0 DOWN  
10 YARDS TO GO

-----  
START AT 39 YARD LINE  
NOW ON 38 YARD LINE  
61 YARDS TO TOUCHDOWN

-----  
ON THIS PLAY HARTNELL'S RAIDERS CAN  
EITHER 1 - THROW  
2 - CARRY  
OR 3 - PUNT

Once you've decided on your play, the computer will begin a count from one to eleven. You have to get rid of the ball during that count. If you don't do so in time, you'll be sacked and lose yardage or possession.

HARTNELL'S RAIDERS, YOUR QUARTERBACK HAS  
GOT THE BALL

-----  
WAIT FOR THE COUNT, HARTNELL'S RAIDERS,  
THEN HIT ANY KEY... .

1  
2  
3  
4  
5  
6

-----  
NICE PUNT...  
YOU'VE KICKED 24 YARDS

The rules behind this simulation tempt you to wait as long as possible before delivering the ball. The longer you wait, the farther the ball will travel. For example, if you decide to throw the ball, and you stop the count on two, the ball will only travel ten yards, but if you'd stopped the count on ten, it would have gone forty yards.

THE BALL IS CAUGHT  
AND RETURNED 1 YARDS  
AND RETURNED 2 YARDS  
AND RETURNED 3 YARDS  
  
AND RETURNED 17 YARDS  
AND RETURNED 18 YARDS  
AND RETURNED 19 YARDS  
AND RETURNED 20 YARDS

THE BALL IS DOWN ON  
SILICON COWBOYS'S 58 YARD LINE

SILICO O HARTNE O  
59.7 MINUTES TO GO

-----  
SILICON COWBOYS IN POSSESSION  
O DOWN  
10 YARDS TO GO  
-----

START AT 58 YARD LINE  
NOW ON 58 YARD LINE  
42 YARDS TO TOUCHDOWN

-----  
ON THIS PLAY SILICON COWBOYS CAN  
EITHER 1 - THROW  
2 - CARRY  
OR 3 - PUNT

As you can see, the fact that you've thrown a given distance does not mean the play will be completed successfully. The chances of a play being complete are linked to the distance thrown.

TOUCHDOWN!!!  
TOUCHDOWN!!!  
TOUCHDOWN!!!  
TOUCHDOWN!!!  
TOUCHDOWN!!!  
SILICON COWBOYS 6  
HARTNELL'S RAIDERS 0  
TO PLAY FOR EXTRA POINT  
> PRESS ANY KEY <

There is a lot of action in this simulation, and you're sure to enjoy dressing it up even more. Here are a few additional scenes of the program in action:

AND RETURNED 27 YARDS  
AND RETURNED 28 YARDS  
AND RETURNED 29 YARDS  
AND RETURNED 30 YARDS  
AND RETURNED 31 YARDS

## The Grand Slam

In this sports simulation, you have a chance to play a three-set match of tennis against your computer. If you prefer, you can also play against another human being, with the simulation reporting on, and moderating, the action.

Tennis got its start in England in the middle of the last century. By 1877 it was such a popular game that a national championship was staged at Wimbledon. There is a maximum of five sets in a match for men, and three for women. You have to win a maximum of six games to win a set. You need to lead by two games in order to win a set.

The simulation calls on your decision-making skill and tests your reflexes. Your first decision concerns the speed of your serve. If you elect to play against the computer, it will always serve first, in order to allow you to see it in action. You'll learn a lot more about the simulation from watching the computer serve than from reading this introduction.

The simulation is weighted so that fast serves have a better chance of an ace than do slow serves, but there is also a greater chance of a fault. Slow serves will rarely result in an ace, but are also unlikely to be faults.

After the serve, the simulation calls on your reflexes. The screen clears and indicates whose court the ball is in. After a brief pause, the computer will begin a countdown to -1. To hit the ball, you need to wait until the count reaches zero, and then press any key.

If you "swing" too soon or too late, you'll miss the ball, and the computer will tell you whether the ball was in or out of play. Note that you can choose to leave a ball, if you think it is going to go out. If you "hit" the ball by striking a key just as the count reaches zero, the screen will clear and show the ball in the other player's court. This process continues until one player or the other misses the ball.

The program begins by asking you whether there will be one human player or two. If there is only one, it will ask for the player's name with the prompt NAME OF SECOND PLAYER?:

```
ONE HUMAN PLAYER OR TWO? 1  
NAME OF SECOND PLAYER? TIMOTY
```

This simulation needs names that are six letters long. If you enter a longer name, the computer will cut it down to size. The computer player's name, as you'll see in a moment, is "Bjornx". The match begins with Bjornx serving:

```
BJORNX SERVING  
DO YOU WANT TO SERVE 1 - FAST  
OR 2 - SLOW
```

```
1 > IT'S A FAST SERVE...
```

Bjornx elects a fast serve, and the mere human must attempt to return it:

```
TIMOTY, THE BALL IS  
IN YOUR COURT
```

```
-----  
HIT ANY KEY, WHEN YOU SEE THE ZERO,  
TO RETURN THE BALL...
```

5

4

3

2

1

```
YOU MISSED THE BALL, AND...  
IT WAS IN...BAD MISTAKE
```

Unfortunately, Timoty is not playing with his usual fine form.  
The score is shown before Bjornx serves again:

	SET	SET	SET	
	1	2	3	GAME
BJORNX	0	0	0	30
TIMOTY	0	0	0	0

BJORNX SERVING  
DO YOU WANT TO SERVE 1 - FAST  
OR 2 - SLOW

1 > IT'S A FAST SERVE...

The scoring system in our simulation follows the real game, with a minimum of four points needed to win a game: 15, 30, 40, and game. If both sides score 40, "deuce" is declared, and the first player to score a point is said to have the "advantage." A further point is needed to win. If the opponent gets a point instead of the player with the "advantage," the score returns to "deuce." Of course, you do not have to worry about this scoring system, as the computer obligingly keeps track of everything for you.

Here are a few more "snapshots" of the game in progress:

GAME TO BJORNX

	SET	SET	SET	
	1	2	3	GAME
BJORNX	1	0	0	0
TIMOTY	0	0	0	0

TIMOTY SERVING  
DO YOU WANT TO SERVE 1 - FAST  
OR 2 - SLOW

1 > IT'S A FAST SERVE...

....OUT....  
...SECOND SERVE...  
TIMOTY SERVING  
DO YOU WANT TO SERVE 1 - FAST  
OR 2 - SLOW

2 > IT'S A SLOW SERVE...

-----  
SET SET SET  
-----  
1 2 3 GAME  
BJORNX 6 0 0 0  
TIMOTY 1 0 0 40

TIMOTY SERVING  
DO YOU WANT TO SERVE 1 - FAST  
OR 2 - SLOW

2 > IT'S A SLOW SERVE...

-----  
SET SET SET  
-----  
1 2 3 GAME  
BJORNX 6 0 0 15  
TIMOTY 1 1 0 0

BJORNX SERVING  
DO YOU WANT TO SERVE 1 - FAST  
OR 2 - SLOW

1 > IT'S A FAST SERVE...

It appears that the human race is no match for the mighty computer:

	SET	SET	SET	
	1	2	3	GAME
BJORNX	6	4	0	30
TIMOTY	1	2	0	40

TIMOTY SERVING  
DO YOU WANT TO SERVE 1 - FAST  
OR 2 - SLOW

2 > IT'S A SLOW SERVE...

	SET	SET	SET	
	1	2	3	GAME
BJORNX	6	4	0	{DEUCE
TIMOTY	1	2	0	{DEUCE

	SET	SET	SET	
	1	2	3	GAME
BJORNX	6	6	6	0
TIMOTY	1	4	4	0

## Driving a Racing Car

Now you have the chance to drive a simulated racing car around your choice of four of the world's greatest Grand Prix circuits. You, too, can be a hero on the British course known as "The Whale," at Germany's "The Key," on the Italian track called "The Shoe," or on the 3100-meter track at Monaco.

The program begins by asking your name, wishing you luck, and asking you which track you wish to try and how many laps the race will be over:

WHAT IS YOUR NAME, DRIVER? HARTNELL

OK, GOOD LUCK, HARTNELL

OK, GOOD LUCK, HARTNELL

OK, GOOD LUCK, HARTNELL

\*\*\*\*\*

WHICH RACE DO YOU WANT TO TAKE PART IN:

BRITISH GRAND PRIX	2650MT	:1
GERMAN GRAND PRIX	1700MT	:2
ITALIAN GRAND PRIX	2200MT	:3
MONACO GRAND PRIX	3100MT	:4

ENTER A NUMBER (1 TO 4)

\*\*\*\*\*  
OK, THE BRITISH RACE  
\*\*\*\*\*  
OVER HOW MANY LAPS?  
? 1

The aim of the simulation, naturally enough, is to complete the race as quickly as possible, without crashing and without overheating either your engine or your brakes. The race begins as follows:

You start the race, as the fifth line down indicates, in the sixth position. On the British circuit, you start the simulation at 140 kilometers an hour, just under the speed recommended for the approaching corner. To increase your speed, you hit the "M" key. The "Z" key will slow you down, and the space bar allows you to maintain the same speed.

A few seconds after the above "snapshot" of the simulation, the screen looked like this:

```
ENGINE TEMPERATURE 100 C. [MAX. 200]
BRAKE TEMPERATURE: 10 C. [MAX. 500]
DISTANCE COVERED: 0 METERS
: 0 LAPS
YOU'RE IN POSITION 6
-----
CURRENT SPEED: 140 KPH
: 77.7 METERS PER MOVE
-----
CORNER APPROACHING 800 METERS
RECOMMENDED SPEED: 150 KPH
-----
```

The simulation run began with the first corner 800 meters away. This has now shrunk to just 57 meters, and I've increased my speed to 148 kph, just below the recommended speed for taking that corner of 150 kph. The engine has warmed up slightly, but still a long, long way away from the maximum of 200 C., and the temperature of the brakes has gone up from 10 degrees to nearly 55.

```
ENGINE TEMPERATURE 104.6 C. [MAX. 200]
BRAKE TEMPERATURE: 54.7 C. [MAX. 500]
```

DISTANCE COVERED: 742.2 METERS  
: .28 LAPS

YOU'RE IN POSITION 6

-----  
CURRENT SPEED: 148 KPH  
: 82.2 METERS PER MOVE

-----  
CORNER APPROACHING 57 METERS  
RECOMMENDED SPEED: 150 KPH

I safely negotiate that corner, but find that I have perhaps been a bit too cautious: with just under half of the one-lap race completed I have fallen back to the seventh position after starting in position six:

ENGINE TEMPERATURE 87.1 C. (MAX. 200)  
BRAKE TEMPERATURE: 157.3 C. (MAX. 500)  
DISTANCE COVERED: 1102 METERS  
: .41 LAPS

YOU'RE IN POSITION 7

-----  
CURRENT SPEED: 112.3 KPH  
: 62.3 METERS PER MOVE

-----  
CORNER APPROACHING 97 METERS  
RECOMMENDED SPEED: 90 KPH

I am just 97 meters from the next corner, where the recommended cornering speed is 90 kph. I'm doing just over 112 kph. Frantically, I slam on the brakes, punching at the "Z" key. But it is too late:

YOU CORNERED AT 104.8 KPH  
AND THE MAXIMUM SPEED WAS JUST 90  
YOU SPIN OFF THE TRACK...  
.....AND CRASH!!!!

-----  
YOU ONLY COMPLETED 1218.4 METERS,  
OR .45 LAPS AND AT THAT  
STAGE WERE IN POSITION 7

YOUR AVERAGE SPEED WAS 137.07 KPH  
YOU WERE 2 TH FASTEST ON STRAIGHTS,  
AND 12 TH FASTEST ON CORNERS.

PRESS 'S' FOR SAME RACE, 'N' FOR NEW  
RACE, 'E' TO END

I was in seventh place when my race ended. The final screen tells me my average speed was a shade over 137 kph, I was second fastest on the straights, and only twelfth fastest on the corners.

As you can see, you are given the choice of running the same race again (by pressing "S"), choosing a new race ("N"), or ending the simulation ("E").

I press "N" and decide on the German circuit:

\*\*\*\*\*  
WHICH RACE DO YOU WANT TO TAKE PART IN:

BRITISH GRAND PRIX	2650MT	: 1
GERMAN GRAND PRIX	1700MT	: 2
ITALIAN GRAND PRIX	2200MT	: 3
MONACO GRAND PRIX	3100MT	: 4

ENTER A NUMBER (1 TO 4)

\*\*\*\*\*  
OK, THE GERMAN RACE  
\*\*\*\*\*

OVER HOW MANY LAPS?  
? 1

This time, I take fewer risks, and am soon on my way to completing the circuit without mishap:

ENGINE TEMPERATURE 117.5 C. (MAX. 200)  
BRAKE TEMPERATURE: 34.5 C. (MAX. 500)  
DISTANCE COVERED: 1424.3 METERS  
: .83 LAPS  
YOU'RE IN POSITION 27

-----

CURRENT SPEED: 116.3 KPH  
: 64.6 METERS PER MOVE

---

CORNER APPROACHING 75 METERS  
RECOMMENDED SPEED: 200 KPH

---

A few careful moments later, and I've done it:

WELL DONE, HARTNELL!!

---

YOU MANAGED TO LAST OUT THE FULL  
1 LAP RACE...

---

The main value of this simulation, apart from that of its high entertainment potential, is showing how the facts of "real life" (such as the engine speed maximum, and the data on each track) can be encoded into a program. You can also see how the formulas link the various outputs together in a realistic way—for example, how lines 370 and 380 work out how far you have traveled, by converting your speed in kilometers per hour into meters.

Note also that lines 320 and 330, which act on your attempts to speed up or slow down, add or subtract a value that is related to the actual speed you are traveling. This means you can brake more dramatically when you are moving quickly than you can while moving slowly. Using a value that is related to current speed also overcomes the realism-destroying practice of just changing the current speed by a fixed value each time a key is pressed.

YOU FINISHED IN 30 POSITION,  
AFTER STARTING IN 6TH POSITION...  
YOUR AVERAGE SPEED WAS 100.38 KPH  
YOU WERE 14 TH FASTEST ON STRAIGHTS,  
AND 47 TH FASTEST ON CORNERS.

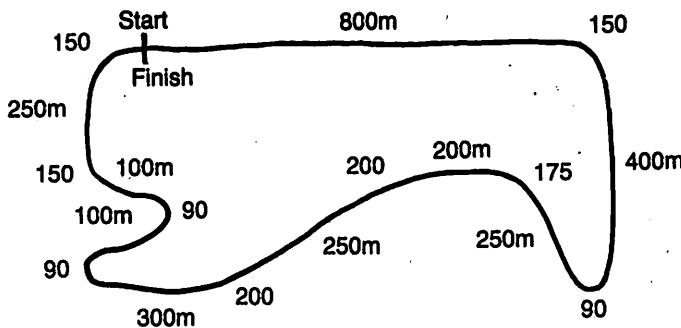

PRESS 'S' FOR SAME RACE, 'N' FOR NEW  
RACE, 'E' TO END

## The Tracks

Here are the four Grand Prix circuits that are encoded within the program.

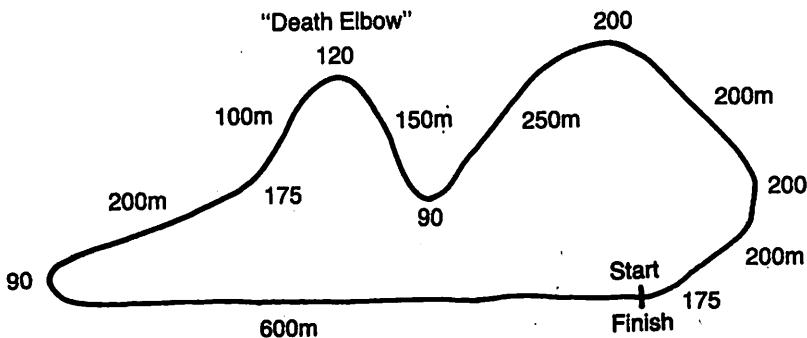

### British Grand Prix

"The Whale," 2650 meters:

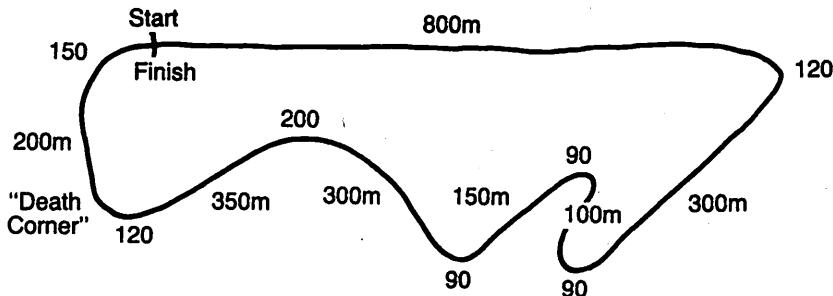

### German Grand Prix

"The Key," 1700 meters:

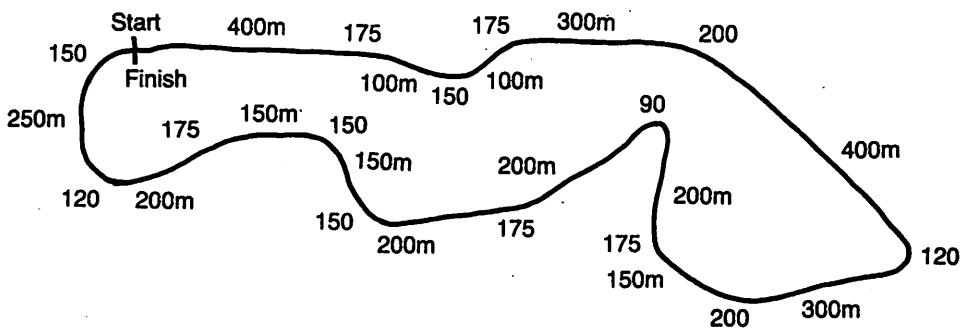

## **Italian Grand Prix**

## **“The Shoe,” 2200 meters:**

## **Monaco Grand Prix**

**3100 meters:**

**Numbers not followed by "m" indicate maximum cornering speeds.**

**Numbers followed by "m" (for meters) indicate distances between corners**

## **Up, Up and Away**

Flight simulators are probably the most entertaining type of simulation programs. Most of us will never learn to fly, but would somehow like to enjoy the experience. A flight simulation program gives you a chance to find out a little of how it feels to fly without ever leaving the ground.

The main challenge facing a pilot is to keep on top of a number of different elements that are changing all at once. Ignore any one of them—like the angle at which the plane is flying, or the amount of fuel you have left—for too long, and your plane may well drop out of the sky. Although this program does not occur in real time, so you'll have a chance to think about the choices facing you before you act, you'll still find it a fairly challenging and frustrating simulation to master.

Even getting the plane off the ground is not particularly easy the first few times you run the program. Get it in the air, and you'll have to fight every second to keep it there.

And once you try to land . . .

Crashing during a landing attempt is a trifle inconvenient in a real plane. The moment you try and land 150 feet above the ground, you'll give thanks that you are only flying your computer.

### **Mastering the Controls**

This simulation is the most complex in the book. It will take you

a little longer to learn than the others. This longer learning time will, however, be amply repaid as you're sure to find this program by far the most satisfying to run. FLIGHT SIMULATION contains another bonus that makes it very worthwhile to run. Your flight is automatically recorded, so that at any moment, while you're still in the air, you can tell the computer you want to see the whole of the current flight over from the beginning. It is very entertaining to watch your flight quickly unfolding again. The controls are handed back to you once you reach the point in the original flight where you asked the computer for a replay.

Think of the flight as having three parts, each of which requires a different approach to the controls. Part one is the takeoff, part two is the actual flight, and part three is the landing. You'll become an ace pilot fairly quickly if you concentrate on mastering each flight section in turn.

Whatever you do, don't give up, even after your twentieth attempt at landing has ended in disaster. The satisfaction you'll feel when you make your first perfect landing will more than compensate for all the frustration you've encountered in the learning process.

This is what you'll see when you first run the program:

HORIZON	HEADING
:	-----:
:	: .N. :
:	: ..@.. :
:	: .. I .. :
:	: * * * * * : W--X--E :
:	: .. : .. :
:	: .. : .. :
:	: .S. :
:	-----:
: RANGE 0 : TIME .1 : 226	
:	-----:
: AIRSPEED : 0	
:>	
: ALTIMETER: 0	0 DEG.
:>	
: FUEL	: 750
:	----->
:	-----:
: ELEVATION: 0 :	-----
:	> UNDERCARRIAGE DOWN < :

The line of asterisks in the top left corner shows the horizon line. This can tilt rather alarmingly from side to side as you turn the plane, or go to the bottom of the "windshield" as you climb, or to the top as you descend. It may take a short while in order for you to be

able to see this line as the horizon, but once you do, you'll find it conveys a much better impression of being in the air than you might imagine.

To the right of the horizon is your compass. The "@" shows the direction your plane is heading. You always start a flight facing due north, and must take off more or less in this direction. Your exact heading is shown further down the instrument cluster, on the same line as ALTIMETER, where you'll see "0 DEG.".

The line of readings underneath the horizon and compass shows the distance you've covered so far (the "range"), the elapsed time of the flight, and the direction in which you must be flying in order to land—assuming that you get this baby up in the air, and keep it there for more than a few seconds! You need to be within 12 degrees of this heading for a successful landing. The required heading changes from run to run, but does not change during a flight.

Shown underneath this is your airspeed, height above the ground (altimeter), and remaining fuel. The line of dashes ending in a "greater than" sign (--->) indicates the magnitude of each of these readings. That is, the line gets longer as you go faster or climb higher.

The elevation is the angle of your plane relative to the ground. When you enter a command, by touching a single key, a full-word version of the command appears in the position currently occupied by the series of dashes you can see after the elevation angle in the sample run above. Finally, you are told whether or not your undercarriage is down.

After a few inputs, the screen looks like this:

HORIZON	HEADING
:	-----:
:	: .N. :
:	: ..@.. :
:	: .. : .. :
:	: *----* : W--X--E :
:	: .. : .. :
:	: . . . . :
:	: .S. :
:	-----:
: RANGE .8 :	TIME 1.3 : 228
:	-----:
: AIRSPEED :	30
: ->	
: ALTIMETER:	0 0 DEG.
: >	
: FUEL :	682
:	----->
:	-----:
: ELEVATION: 20 :	NOSE UP
:	> UNDERCARRIAGE DOWN < :

Your fuel has gone down slightly, your airspeed is up to 30, and the nose of the plane is pointed 20 degrees into the air. You can see, from the line down near the bottom right-hand corner of the screen, that NOSE UP is the full equivalent of the most recent command you entered.

A little later, and we are in the air:

HORIZON	HEADING
:	: .N. :
:	: ..@.. :
:	: .. : .. :
:	: W--X--E :
: *****	: .. : .. :
:	: .. : .. :
:	: .S. :
:-----:	
: RANGE 1 :	TIME 2 : 226
:-----:	
: AIRSPEED : 51	
:-->	
: ALTIMETER: 66 359 DEG.	
:-->	
: FUEL : 660	
:----->	
:-----:	
: ELEVATION: 19 : THROTTLE ON	
: > UNDERCARRIAGE DOWN < :	

You need an airspeed of between 45 and 60, and an elevation greater than 10, in order to get off the ground. Let's try turning:

HORIZON	HEADING
:	: .N. :
:	: ..@.. :
:	: .. : .. :
:	: W--X--E :
:	: .. : .. :
:	: .. : .. :
:	: .S. :
:-----:	
: RANGE 1.2 :	TIME 2.3 : 226
:-----:	
: AIRSPEED : 40	
:-->	
: ALTIMETER: 143 344 DEG.	
:---->	
: FUEL : 648	
:----->	
:-----:	
: ELEVATION: 15 : BANK LEFT	
: > UNDERCARRIAGE UP < :	

Note that the undercarriage is now up (which saves on fuel by decreasing drag on the plane) and the "horizon" is now sloping to down to the right, as the plane banks left. It is now heading at 344 degrees, and the @ symbol on the compass has moved to show the approximate direction in which the plane is flying.

```

HORIZON          HEADING
:-----:-----:
:       : .N.   :
:       : ..@..  :
:       : ...  .. :
:       : W--X--E :
:       : ...  .. :
:       : ..  ..  :
:       : .S.   :
:-----:
:RANGE 3.1 : TIME 3.7 : 226
:-----:
:AIRSPEED : 58
:-->
:ALTIMETER: 353      3 DEG.
:----->
:FUEL    : 580
:----->
:-----:
:ELEVATION: 7 : BANK RIGHT
:     > UNDERCARRIAGE UP < :

```

In this "snapshot," taken a few moments later, we have started to bank to the right. Our airspeed is up to 59, and we've continued to climb. However, the elevation has fallen, so the rate of climb will decrease. As we level off, the horizon gradually tilts back to the horizontal:

```

HORIZON          HEADING
:-----:-----:
:       : .N.   :
:       : ..@..  :
:       : ...  .. :
:       : W--X--E :
:       : ...  .. :
:       : ..  ..  :
:       : .S.   :
:-----:
:RANGE 3.8 : TIME 5.3 : 226
:-----:
:AIRSPEED : 76
:-->
:ALTIMETER: 475      15 DEG.
:----->
:FUEL    : 525
:----->
:-----:
:ELEVATION: 12 : THROTTLE ON
:     > UNDERCARRIAGE UP < :

```

As I said, there are an awful lot of things to keep track of. While concentrating on the direction in which I'm flying, I've been neglecting the plane's elevation—which has been slowly falling:

HORIZON	HEADING
*****	.N.
***	...@.
****	W--X--E
***	... . .
	... . .
	.S.
:-----:	
:RANGE 7.4, : TIME 6.9 : 228	
:-----:	
:AIRSPEED : 152	
:----->	
:ALTIMETER: 593	31 DEG.
:----->	
:FUEL	: 457
:----->	
:-----:	
:ELEVATION: 0 : THROTTLE ON	
: > UNDERCARRIAGE UP <	

Suddenly I notice the nose is pointing downward—note how the horizon is now right at the top. I frantically try to climb:

HORIZON	HEADING
*****	.N.
***	... . .
****	... @.
***	W--X--E
	... . .
	... . .
	.S.
:-----:	
:RANGE 11.3 : TIME 6.1 : 228	
:-----:	
:AIRSPEED : 245	
:----->	
:ALTIMETER: 250	47 DEG.
:----->	
:FUEL	: 403
:----->	
:-----:	
:ELEVATION:-11 : CLIMB	
: > UNDERCARRIAGE UP <	

However, too much is happening at once, with the inevitable result:

CRASH!  
CRASH!

The final picture is pretty bleak:

HORIZON	HEADING
C R** A ** S*	.N.
* A ** S* H*	... .
R** A ** S* H	.. . .
R** A ** S* H	W--X--E
A ** S* H*	... . .
** A ** S* H	... . .
* C R** A **	S.
-----	
RANGE 14.1	TIME 9.2 : 226
-----	
AIRSPEED : 273	
>	
ALTIMETER: 0 84 DEG.	
>	
FUEL	368
>	
ELEVATION:-16 THROTTLE ON	
> UNDERCARRIAGE UP <	

**The commands you have at your disposal are:**

- R** This allows you to repeat the current flight from the beginning up to that point.
- Space bar** This is used for "throttle on," and increases your speed.
  - Use this to throttle back.
- Q** To increase elevation.
- A** To decrease elevation.
- Z** To turn left.
- M** To turn right.
- 1** To change undercarriage from up to down, or from down to up.

Remember, to take off your speed must be between 45 and 60, and your elevation must be greater than 10. To land, your undercarriage must be down (!), your heading must be within 12 degrees of the setting shown beneath the compass, you must be at 15 or below on your altimeter, and your speed must not be greater than 20. You'll find that, as in real life, landing is even harder than taking off.

The complete FLIGHT SIMULATION listing is given in the next chapter.

---

# 24

---

# **Additional Listings for APPLE IIe and COMMODORE 64**

**SPECIAL INSTRUCTIONS FOR COMMODORE PROGRAMMERS:** You'll note that many of the PRINT statements in the Commodore 64 listings begin with three-letter codes within brackets, like this: [RED].

*Do not type these in directly.* These indicate the use of the Commodore's number keys to control screen colors. (Note that each of the number keys also has a color marked on it.)

For example, when you see [RED] in the listing, you should press the "CTRL" and the "RED" key—which is also the "3" key—at the same time.

## **Other Sources**

*BYTE* magazine (a McGraw-Hill publication) devoted a major portion of its March 1984 issue to computer simulations. The October 1985 issue concentrated on simulations involving society and human behavior.

# Acknowledgments

The oxygen cycle (chapter two) is based on information from Hoyle, T. *The Last Gasp*, Sphere Books Ltd., London, UK, 1983

Details of the *Mind Monitor* and power station simulator (chapter one) are from *The Australian* newspaper, February 29, 1985

Information used to create the flight simulation program (chapter twenty-three) came from:

Birch, N. H. & A. E. Bramson, *Flight Briefing for Pilots, Volume 4*, Pitman Publishing, London, UK, 1970

Champion P., *Glider Pilot*, Model and Allied Publications Ltd., Hemel Hempstead, UK, 1974

Flying Magazine (editors), *Flying Wisdom*, Van Nostrand Reinhold Company, New York, 1979

Material related to the robot simulation programs (chapters seven, eight, and nine) can be found in:

Bonner, P., *Build Your Own Gladiator*, article in *Personal Software magazine*, December 1983, pp. 123-127 and 198

Burnett, J. D., *Logo, an Introduction*, Creative Computing Press, Morris Plains, New Jersey, 1982

Peddicord, R. G., *Understanding Logo*, Alfred Publishing Company, Inc., Sherman Oaks, California, 1983

Robillard, M. J., *Advanced Robot Systems*, Howard W. Sams and Company, Inc., Indianapolis, Indiana, 1984

Siklossy, L., *Let's Talk Lisp*, Prentice-Hall, Inc., Englewood Cliffs, New Jersey, 1976

## Program Authors:

SPACE LANDING—Tim Hartnell; MONTE CARLO—Tim Hartnell; SIMULTANEOUS EQUATIONS—Tim Hartnell; LIFE—Tim Hartnell; ROBOT LOGO and POINT DUTY ROBOT—Tim Hartnell; CONNECT FOUR—Anthony W. Pearson; QUEVEDO CHESS MACHINE—Tim Hartnell; WASHINGTON D.C.—Philip J. Coates; STOCK MARKET—Philip J. Coates; DETROIT CITY—Philip J. Coates; GRIDIRON—Philip J. Coates; TENNIS—Philip J. Coates; GRAND PRIX—Philip J. Coates; FLIGHT SIMULATION—Tim Hartnell

Apple program conversions by Robert Young; Commodore 64 program conversions by Ross Symons.

If you enjoy playing or programming BASIC computer games, you're ready for the book that poses the ultimate challenge:

## **REPLICATING REALITY**

---

Master gamesman Tim Hartnell takes you into the exciting world of computer simulation games and teaches you how to:

- Model real-life situations with computer programs
  - Make your computer simulations as realistic as possible
  - Create your own exciting simulation programs
- 

## **CREATING SIMULATION GAMES ON YOUR COMPUTER**

contains a dozen full-scale, ready-to-run simulation programs, ranging from

- Buying and selling on the **STOCK MARKET**, to
  - Running a multimillion-dollar automobile manufacturing company in **DETROIT CITY**, to
  - Flying a small airplane in **FLIGHT SIMULATION**
- 

Featuring the BASIC language program listing for each game and clear instructions for getting the programs running on your home or personal computer.

Tim Hartnell prepares you to create your own simulated worlds—will you be able to tell them from the real thing?

Complete BASIC program listings for the IBM PC, Apple IIe, and Commodore 64
